JANUARY 1, 1914.

State Water Storage Commission, Augusta, Maine.

GENTLEMEN: In accordance with the provisions of Public Laws, 1911, Chapter 170, I beg to submit the annual report of this Commission for the year 1913 and recommend its publication.

On the organization of the office, one of the first things started was a card catalog of the rivers, lakes and ponds of the State. The information is now in such detail that it is deemed advisable to publish it, as it is believed that it will prove of value to the people of Maine.

On account of the length of the gazetteer, other studies resulting from the investigations of the Commission will be held for the next report. These unpublished data include the monthly estimates of discharge for 1913 at the regular gaging stations in the State; tables showing the discharge in cubic feet per second per square mile arranged in the order of magnitude, or duration tables, as they are sometimes called, of the rivers of the State for which daily discharge measurements are available. In the Third Annual Report, page 27, these duration tables or diagrams are described. Computations of the total power of the rivers of Maine are being made in the office of the Commission and will also be published later.

The assistants of the office have been Mr. George C. Danforth, Assistant Engineer, and Miss Elizabeth C. Spooner, clerk.

Very respectfully,

CYRUS C. BABB,

Chief Engineer.

GAZETTEER OF THE RIVERS AND LAKES OF MAINE

In the study of the water resources of Maine, the State Water Storage Commission has divided the State into drainage districts as follows:

St. John River Basin.

St. Croix River Basin.

Coastal Basin No. 1, the drainage between the St. Croix River and Machias River and including the following streams: Little, Pemaquam, Dennys, Cathance, Little Falls and Orange rivers and various small tidewater streams.

Machias River Basin.

Coastal Basin No. 2, including the following streams: Chandler, Indian, Pleasant, Narraguagus, Tunk and Bagaduce rivers and various small tide-water streams.

Union River Basin.

Penobscot River Basin.

Coastal Basin No. 3, including the following streams: Goose, Wescot, Passagassawakeag, Duck Trap, Megunticook, St. Georges, Medomak, Pemaquid, Damariscotta and Sheepscot rivers and various small tidewater streams.

Kennebec River Basin.

Androscoggin River Basin.

Royal River Basin.

Presumpscot River Basin.

Saco River Basin.

Coastal Basin No. 4, including the following streams: Kennebunk, Mousam, York and Piscataqua rivers.

The gazetteer is arranged alphabetically by these drainage basins and has been compiled from the best maps available to the office of the State Water Storage Commission. For this purpose, the following have been used: The special lake and river maps as issued by this department and listed in the Third Annual Report, page 5; the regular topographic sheets of the U. S. Geological Survey; the township plans in the office of the

State Assessors; many private recent reservoir and township maps on file in this office; and, in a few cases, county atlases where more accurate maps were not available. The areas of the lakes and ponds were measured by planimeter from the maps in question. In the text, after the area of water surface of each lake and pond, there is given in parenthesis, the map authority from which it was measured, and one can thus judge of the accuracy of the measurement. There are many townships, especially in the wild land districts, of which no accurate maps are available, and some of the lake areas are undoubtedly in very considerable error.

The explanation of the abbreviations used is given below. They refer generally, either to the maps on which the lake areas were measured or to the original surveys of the State and indicated on many maps of the State.
