ADVISORY COUNCIL

ARCHER GROVER
Deputy Commissioner

STATE OF MAINE

To His Excellency, William Tudor Gardiner, Governor of Maine:

The Commissioner of Inland Fisheries and Game herewith submits his annual report for the fiscal year ending June 30th, 1932, giving a general account of the work accomplished in the last twelve months.

GEORGE J. STOBIE

Commissioner

STATE OF MAINE

To His Excellency, the Governor, and the Honorable Council:

The years 1931-1932 have been a continuation of plans laid out at the first meeting of the Advisory Council in 1929. These plans have worked out so successfully that practically no changes have been made in them since their start. I believe that the increase in fish output and the increase in game throughout the State is ample proof of the soundness of these plans.

The Department is greatly indebted to you and your Council for the wonderful cooperation you have given us during your terms of office. Without this cooperation it would have been quite impossible for the Department to accomplish what it has.

FISHING

The reports on fishing in Maine would tend to show that it is growing better each year, this last year showing quite an improvement over 1930. However, the fishing has been spotty in some sections. This can be attributed to a lack of rainfall during the fall of 1931, which left many of our lakes and ponds at low water mark. These ponds on filling up in the spring naturally washed in lots of food at about the time the ice left the lakes and ponds with the result that fish were too well fed to readily take bait. These waters after reaching normal heights and starting to recede began to give good fishing. The condition of the river, brook and stream fishing has been a great deal

better than in former years, due to a heavy stocking during the past year. Many brooks and streams which have been found in the past not suitable for fish life have been eliminated and much waste has been done away with.

A visible increase in size of fish has been noticed by many sportsmen in many waters. In the taking of brood fish at the

Daigle Sisters Holding Spawn Fish at Guerette

Raymond Hatchery during the fall of 1931 a marked increase was seen in the size of the brood fish. It was estimated that they would average from one pound to one and one-half pounds more than the year before. This was also found true in other places where the Department takes eggs from the brood fish. There are many encouraging signs which I believe will go a long ways toward making better fishing, some of which are that many

of the sporting camp owners or the commercial camps, so-called, are impressing upon the minds of those who come to their camps that they should take only those fish which they, as guests, desire for table use while stopping at these camps. They do not ask them to stop fishing, but to return to the waters those fish which they do not actually need. There has been a noticeable change reported by wardens and sportsmen that this is holding true not only among the camp owners but others as well. It is an unusual thing now to find a real fish hog such as we have experienced in the past. Sportsmen are beginning to realize that their cooperation is needed if they expect the State to reach their demands. I believe there is much fishing yet to be developed for those unable to go to distant points or to hire boats from sporting camps and others who have boats to let. Most all cities and towns are located on rivers or large streams.

Spawn Fish Taken at Guerette

With a slight change in the pollution laws which I believe can be brought about without materially hurting any mill owners, these waters can be made suitable for fish life. Then again, we have certain lakes and ponds in the State which are not suitable for trout and salmon, which are suitable for bass, white perch and pickerel. These can be stocked as soon as the Department is financially able to invest in another truck such as would be suitable for the transferring of mature fish over long distances. Many of these fish are put in lakes and in some rivers in sections where only trout and salmon are desired, such as the West Branch of the Penobscot River, and also Chesuncook Lake.

FISHING REGULATIONS

I believe it is now time to revise many of the fishing regulations throughout the State. Due to the many special laws and regulations now in effect, brook and stream fishing is almost a sport of the past. It is my opinion that these regulations have been carried too far. This I believe to be absolutely true at this time, as the State is now well equipped to stock many of these waters where in the past they were unable to do so. Many of our resident and non-resident sportsmen much prefer brook and stream fishing to pond fishing, and I see no good reason why they should not be accommodated.

Lily Bay Rearing Station

In sections of the State where towns and counties are almost wholly dependent upon fish and game for income, few changes should be made, until such time as the Department is better equipped to stock with larger fish in these particular sections.

HATCHERIES

Maine's Hatchery system consists of thirteen Hatcheries and nineteen Rearing Stations, some of which are outstanding, while some of the older ones before being considered successful will have to be remodelled or moved to locations on some suitable waters.

One has already been abandoned as it was found to be not profitable to the State to continue its operation. As time goes on others will be remodelled or changed according to the money available for this purpose.

Probably one of the most successful Hatcheries of its kind (trout raising) is the new Hatchery built at Dry Mills, in the town of Gray. Here we have ideal conditions, namely, the water temperature averages fifty degrees Fahrenheit for the entire year. The water starts from boiling springs, enters the first lines of pools in five different places on line No. 1. As these pools continue other boiling springs are piped in and at the end of the run there are approximately eight hundred gallons of water per minute. On line No. 2 many small springs are joined together in forming two branches of pools which are finally run together to form one big main line which carries approximately six hundred and fifty gallons per minute. The approximate capacity of this Hatchery is estimated to be from 1,500,000 to 1,800,000 of from four to eight inch fish per year. This Hatchery did not reach its capacity during the last year as only one-half of it had been developed. It is now fully developed and may be expected to produce the above number of fish in 1932-1933. At the end of the fish pools has been constructed a large pond for the raising of brood fish and another small pond middle way on the No. 1 line for the same purpose. The capacity of these two ponds is estimated at 35,000 brood fish, and it is expected that we will be able to take between 5,000,000 and 6,000,000 eggs per year. These eggs alone will almost pay for the running of the entire Hatchery. Brood fish will be hand picked, with the idea in mind of developing a fast growing hardy trout. Present indications would lead us to believe that we will experience success. Probably the most important thing to be considered at this Hatchery is the known fact that it requires only a matter of thirty-four to forty days to hatch the trout eggs. This means that the trout raised in this station are approximately two inches in length before the eggs are even hatched in many of the other Hatcheries. The rate of growth of fish reared in this Hatchery is much above normal. Fish hatched in January are turned out in August and September having attained a length of six inches or over. Many experiments have been conducted with different fish foods, some

of which are our own and others supplied by the Birdseye Laboratories, of Gloucester, Mass., the analysis of which is all being done by the Birdseye Laboratories, and announcements regarding this work will be made after the experiments have been conducted over a period of twelve months. It was at first thought that the ideal conditions as existing at this Hatchery were responsible for the rapid growth of trout. This has been found to be not wholly true, as fish taken from this same Hatchery

**Supt. Plummer Traying Eggs
at Sebago Hatchery**

and transferred to the Jackman Feeding Station, which is considered one of the poorest feeding stations, are transplanted in the waters of that section during the latter part of September and October, and at the time of planting had attained a size of from five to as high as seven inches. This would lead us to believe that with an early hatch such as is attained at this Hatchery, and with proper feed when transferred to other Hatcheries or other Feeding Stations, we may expect to turn out in the future many more larger fish than we have ever been able to turn out in the past.

A new Hatchery was constructed at Littleton, under very much the same conditions as those at Dry Mills. This is smaller, but up to the present writing has proven nearly as successful as the Dry Mills Hatchery. The value of this Hatchery is great, due to the fact that the feeding stations in Aroostook County can now be filled with two inch trout in the early spring and then in the fall the lakes and ponds and streams would be supplied with six to seven inch fish rather than two and one-half to three inch fish as in the past. As funds are available more pools will be added.

A rearing station was constructed in the town of Norridge-
wock, with a capacity of approximately 200,000. This has only
been in operation a short time but the present indications are
that it will meet with success.

The number of fish distributed for the year was 9,275,406,
divided as follows:

5,146,567 trout
3,668,794 salmon
278,981 rainbow trout
181,064 togue

A new experiment has been started in taking bass from the
Kennebec River for the purpose of stocking nearby lakes. Five
hundred and eighty large sized bass have been taken to date
and it is expected that many more can be taken in the fall
months.

A Satisfied Party

SCREENS

During the fiscal year ending June 30th, 1932, twelve screens were constructed. For ten of these the Legislature appropriated various amounts to help in the construction. The waters thus screened by the Department in cooperation with local interested citizens and organizations were: Lermond's Pond, Knox County; Togus Pond, Kennebec County; Bauneg Beg Pond, York County; Anasagunticook Lake, Oxford county; Orneville Pond, Piscataquis County; Roxbury Pond, Oxford County; Nash's Lake, Washington County; the outlet of East Pond, Somerset County; Round Pond, Franklin County; and Lower Wilson Pond, Piscataquis County. The accompanying table shows the amount appropriated by the State for these screens, the amount expended in their construction, and also the amount contributed by citizens. The amount contributed by citizens shown in this table is only the money which was received by the Department from these citizens and paid out by the Department. This applies to Roxbury Pond, Nash's Lake, and Lower Wilson Pond. The amount contributed by citizens for the other screens in the accompanying list did not come through the office of the Fish and Game Department, but was paid directly by the local organizations to the contractor.

Besides the above ten screens there were several others, constructed entirely at the expense of the local organizations or citizens, one of them being at the outlet of Sturtevant Pond, in Magalloway Plantation, Oxford County.

New Screen at Roxbury Pond

FISHWAYS

During the winter of 1932 an attempt was made to improve the conditions of the water at the lower end of the fishway in the Bangor Dam on the Penobscot River. The current at the tailrace of this fishway was such that the salmon, instead of being attracted to the entrance of the fishway, were led away from it. In an attempt to improve this condition, the top of a ledge was removed and placed at the east side of the lower end of the fishway which has changed the water currents to considerable extent, and it is hoped that this will improve the fishway. The amount expended in this work was \$1,367.65, of which amount \$1,000 was paid from the State Contingent Fund, and the remainder from the general appropriation of the Department of Inland Fisheries and Game.

An attempt was made to make the Saco River available to sea salmon for a distance of about ten miles above Biddeford. In order to do this, the Commissioner has requested the Cumber-

land County Power and Light Company to install two wooden fishways in two of their dams in the city of Biddeford. The construction of these fishways was begun in June, but they were not completed June 30th.

A similar fishway was constructed in the dam at the outlet of Parmachenee Lake, by the Parmachenee Club. There was no expense to the State in the construction of this fishway. The same is true regarding the two fishways at Biddeford.

A fishway was built on Prestile Stream in the village of Mars Hill, for which \$1,000 was contributed from the general appropriation of the Dept. of Inland Fisheries and Game. The remainder of the cost of this fishway was raised by citizens of Mars Hill.

\$200.00 was contributed by the Department of Inland Fisheries and Game for a dam at the outlet of Sewall's Pond, in the town of Arrowsic, Sagadahoc County.

\$2,000.00 is available for the construction of a fishway in the dam in Sourdabscook Stream, in Hampden Village. This work will be completed in the fall of 1932. For this fishway, \$1,000 was appropriated by the State, and \$1,000 contributed by the town of Hampden.

WARDEN SERVICE

The Warden Service continues to increase in efficiency, although the men have been working under great difficulties, due to lack of employment which has sent many more fishermen and hunters to the lakes and forests than in former years. A great deal of difficulty has been encountered in certain classes who have entered the woods with the intention of living off from our wild life. These individuals are hard to apprehend as they work mostly in the night. It has been necessary for the Wardens to work both night and day in many sections of the State to keep these people under control.

A Warden and One of His "Orphans"

The policy of the Department toward the Warden Service is as follows:

To bring about an understanding of the policy of the State essential to the best performance of their duty, and to convey to them that sense of the importance and dignity of their office essential to respect for, loyalty to and interest in their jobs.

It is the policy of the State of Maine to build up its fish and game industry. To accomplish this purpose every unit of the organization, from the Commissioner down to the most remote Deputy Warden of the State, must work together—harmony, team work and understanding should prevail in every branch and department of the service.

Every Warden is provided with the fish and game laws, and of course is expected to familiarize himself with them. These laws reflect the policy of the State, but the Warden should look beyond the letter of the laws and catch the vision of their spirit.

Wardens are not just fish and game protectors. They are much more than that. They are the State personified, and represent its interests in executing the law. The State is not a mere section of earth confined within certain boundaries. The State is the spirit of the people—the instrument through which the people by their chosen representatives transact their public business. Hence, the Warden, as a citizen of the State, has a personal interest in his work equal to that of any citizen. He is not a man apart from his neighbors and other citizens. He is one of them. He has different duties to perform, of course, but their interests and his are the same; namely, the maintenance of conditions that make for the greatest degree of health, happiness and prosperity and the greatest good to the greatest number of our people and their guests.

The Warden, therefore, should regard himself as a stockholder with an interest in the fish and game business beyond that of a hired man.

The fish and game laws are made to protect and preserve the fish and game; therefore, the first duty of the Warden is to enforce the laws without fear or favor, but in so doing he must use discretion and judgment.

It is an old rule of law that ignorance of the law is no excuse for its violation, and the reason for the rule was that if a person could escape the penalty of a wrongful act by pleading ignorance of the law, no one would be punished and the laws would be nullified. This rule came into force in the early days of the common law, and while it is in force today, conditions are not the same as they were then. Very few people know the fish and game laws, except in the most superficial way, but the essential ones are well known to all our people. The laws against wanton destruction of either fish or game are known to all, and are the ones most essential to enforcement; and as to these, there must be very alert watchfulness.

DEALINGS WITH POACHERS

The poacher is not only a wilful breaker of the law but he is the enemy of the people, and it sometimes happens that he is, through his own lack of ability of seeing straight, an enemy to himself. The Warden

can sometimes convert a poacher by reasoning with him; pointing out to him that if it were not for the law, even the poacher would have to go out of that kind of business for want of game and fish to hunt and kill. How much better it would be for the poacher to use his skill in, and knowledge of, the woods as a guide, and sell his services in an honorable and lawful manner, than it is to skulk and sneak around in the effort to beat the law and the game wardens, and finally, sooner or later, get caught and punished. The Warden should show the poacher where, if all citizens were like him, there would very soon be no game in the woods or fish in the streams. Incidentally, if that day ever came (and a poacher's activities tend in that direction) both his and the Warden's occupation would be gone, together with that of the guides, the camps and every storekeeper, farmer and manufacturer who now enjoys some degree of prosperity because of the stream of money flowing into the State through those who come seeking health and recreation in our forests and on our lakes and streams; and a poacher should be made to realize that he is wrong from the standpoint of his own interests, to say nothing of his work tending to hurt his neighbors, and others who get all or a part of their living through serving or supplying those who come to our hunting and fishing grounds.

Let all Wardens plant this seed in the minds of all with whom they come in contact, so that the incidental sympathy which poachers enjoy at times from unthinking people will become frozen—no person who derives any direct or indirect benefit from our fish and game business will have much sympathy for the man whose actions and influence seek to destroy that business and thus take away the benefits he now enjoys. Particularly should Wardens press this point home to guides who catch the vision of the real significance of the poacher and what his activities mean. The guide has a vital interest in the preservation of fish and game and he should be just as much opposed to the poacher as the sardine men are against the horse mackerel. In the face of popular sentiment against him, the poacher will soon wither away. He would not long escape both wardens and guides who sincerely seek to stop him.

THE INCIDENTAL AND ACCIDENTAL VIOLATOR

In all crime there must be the *intent* to commit the overt act, knowing the same to be a breach of the law. For example: to constitute larceny at the common law "*there must be the specific intent to deprive the owner of ownership in the thing taken away.*" This is the poacher. He intends to rob the State of its property and thereby rob those who, directly or indirectly, derive profit therefrom. Not so with the man who is innocent of any intent to violate the law. Here the Warden finds himself facing a grave responsibility. He must not injure the State by taking an innocent man into court. It is better that two guilty men escape the penalty for a misdemeanor than that one innocent man be arrested and humiliated. While ignorance of the law cannot be pleaded in court as a complete defense, under the technical rules of pleading, it should be considered by the Warden. The bulk of the prohibitions of

the fish and game statutes are not common law crimes and there are situations wherein one may commit a breach under ignorance and with no criminal intent. Such cases require great care, and the Warden should proceed with great caution, remembering always that the policy of the State is to make friends for the fish and game laws and regulations. He must, in the light of his own knowledge, examine the facts, the careers of any who are caught in transgression, so far as known to him, or easily obtainable—their reputation in the communities in which they live; their manner in answering questions and the general tone of their conversation. If his own mind becomes satisfied that the party is guilty of no more than an excusable error—without guilty conscience—he should be kindly and courteously admonished. The law and its purpose should be explained to him. The Warden should make helpful suggestions to him regarding the use of the woods and streams so that he can get the largest recreation out of their use. When that has been done, his gratitude, respect and friendship will have been won, or at least deserved. This is building for the State and it is also adding to character.

After having sifted any particular case as thoroughly as possible, if the Warden still finds himself in doubt, he should report all the facts to his chief and leave the rest to him. The foregoing is upon the assumption that the transaction is with a citizen of the State and county.

THE WARDENS' RELATIONS WITH NON-RESIDENT SPORTSMEN

The Warden's services belong first and foremost to the State; therefore, he cannot act as guide to private parties. He can, however, be cordial, courteous and friendly with strangers, giving them when requested to do so, such information as they may wish. The Warden is a State Officer and as such should conduct himself with dignity and courtesy, but he should not truckle or permit himself to be demeaned, or walked on. His uniform represents the dignity and sovereignty of the State and must be respected by all. The Warden will sometimes find a hunter or fisherman who will make irritating remarks, or who will be truculent and fault finding. This type of sportsman is the most difficult human problem to the Warden. Fortunately they are not numerous, but there is a percentage of them and they must be understood if they are to be dealt with justly. They may be undergoing nervous reactions due to business activities, close attention to their work, or social demands which have deprived them of their needed rest. Our woods and lakes and streams mean more to them perhaps than they realize. With such, the Wardens must be patient, slow to take offense, and as helpful as possible. Even the intelligent grouch will, in the face of such courtesy and forbearance, realize with shame his own petulance and be grateful when it is not resented.

Then again there is the type of men who think that they cannot have a good time in the woods without bringing intoxicating liquor with them, and they are liberal with the bottle. The Warden should never by any chance accept the invitation to drink with them, so long as he is

an employee of the State of Maine. The true Warden is loyal to his State and to its laws, and this loyalty should govern his conduct, with all classes of men. He will win respect for himself more often than he will create displeasure by acting the part of an ideal citizen. Civilization belongs in the woods as well as in the parlors of the rich, and the nearer the Warden can measure up to the conduct of a genuine gentleman, the nearer he will approach to living the true and ideal Warden.

Joseph S. Stickney, Warden Supervisor for the Southern Zone, in charge of seven Chief Wardens and forty-one District Wardens, reports for the year as follows:

The Wardens of this zone have made 674 arrests this year. With few exceptions I consider the Warden force of this zone a very efficient group of officers.

My activities have been with the Chief and District Wardens, aiding and assisting wherever I considered it necessary. I have shown moving pictures and have given lectures to twenty Service Clubs and Granges; twelve Fish and Game Associations; four schools and nine Church Clubs, to approximately five thousand people. My talks have been confined to what you and the Department are doing in the way of propagation, and the improvement of fishing and hunting conditions in our State.

W. B. Small, Warden Supervisor for the Northern Zone, having six Chief Wardens and forty-three District Wardens, reports for the year as follows:

The Wardens for this zone have made 488 arrests for the year, and in 477 of these cases convictions resulted.

We are receiving splendid cooperation from the Courts and from many of the people. I cannot praise too highly the men working in my zone. I believe that with the conditions that have existed during the last year with so many men in the woods they have done unusually well in protecting our fish and game. Practically all the fish distributed in the northern zone have been carefully handled and placed in the suitable waters by the Wardens. They have conducted an educational campaign among the sportsmen with good results.

POLLUTION

An effort will be made at the incoming Legislature to have more satisfactory pollution laws passed for our rivers and streams. Until such laws can be enacted, not much can be done to eliminate pollution in many of our desirable streams.

DEER

The deer kill in Maine last year was 14,942. This shows a large increase over 1930, and an increase of $33\frac{3}{4}\%$ over three years ago. In the face of this increase, our reports were never more favorable than this year. Reports coming in from the various sources such as Wardens, Guides and Sportsmen would lead us to believe that deer are steadily increasing. Maine is now being recognized as one of the great deer states in the Union. It is only reasonable to suppose that due to the large number of people who are not working throughout the State, the increase in deer will possibly be halted somewhat during the coming year. We have had an unusually hard time protecting these animals from the illegal hunters. I believe more stringent laws are necessary to stop night hunting. I also believe that a law forbidding the carrying of firearms into the woods except in open season would be a great conservation move. It is only reasonable to suppose that those carrying high calibre guns in the summer and early fall are carrying them for one purpose only, and that to kill game out of season. A more stringent dog law is needed, not only for the protection of deer but domestic animals as well. Much credit for the large increase in deer is due the Wardens. They have worked diligently and persistently, in the face of many difficulties and obstacles, to accomplish this.

For the season of 1931 reports show that 12,218 deer were shipped by automobile, and 2,724 were shipped by railroad.

BEAR

The number of bear killed during 1931 hunting season would lead us to believe that bear had increased in large numbers. The increase in bear kill in 1931 over 1930 was almost unbelievable. I feel that this is due in great part to the fact that very few berries of any kind were to be found in the wooded sections during the year 1931. Bear were forced to look for food in the inhabited sections where they were easily seen and shot, which I believe will not occur again for many years.

Another Warden with One of His "Friends"

MOOSE

The moose in the State showed very little, if any, increase over 1930. We feel quite safe in reporting that moose are holding their own and that they are continuing to be seen more in the big woods than in former years. I am still of the opinion that a continual closed season for at least ten years is necessary to preserve our moose.

RUFFED GROUSE, OR PARTRIDGE

The ruffed grouse has undoubtedly reached a normal stage throughout the State. The wonderful hatching season was no doubt of great benefit to our greatest game bird. Glowing reports have come in from nearly every section of the State. Many of the sportsmen have asked for a longer open season. I am, however, of the opinion that no longer open season should be allowed at this time. The disease which made great inroads on our grouse several years ago has practically disappeared. I am greatly in hopes that there will be no reoccurrence.

WOODCOCK

The reports on woodcock are difficult to get due to the fact that these birds will lie close and let the hunter go by without taking to flight. Last year the reports during the hunting season were very spotty. I am of the opinion that this was due a whole lot to the warm fall. The Maine flight from the Provinces did not reach Maine until long after the open season. What few reports we have had would tend to show that we may expect good woodcock shooting this coming fall.

PHEASANTS

The Department has continued to distribute eggs and also a few birds which were a gift from the E. I. DuPont Company. Birds liberated in 1930 have done better than we expected. Many have been seen during the spring months and many nests have been found. During the summer months several birds have been seen of various sizes. There seems to be no doubt but what the pheasant will do well in our State, especially so in the southern counties, provided the Fish and Game Clubs will help in feeding them at such times in the winter months when we have deep snows, and I have reasons to believe that they will.

GAME FARM

The last Legislature gave the Department authority to purchase and maintain a Game Farm. A farm was purchased at Dry Mills, in the town of Gray, adjoining the large trout Hatchery. It is expected that this will be in full operation and about 2,000 birds will be available for liberating in the summer of 1933.

Holding Pens at State Game Farm

RABBITS

During the spring of 1932, the Department purchased from different individuals in Hancock and Washington Counties, approximately nine hundred rabbits. These were shipped to Androscoggin, Cumberland, Kennebec, Knox, Lincoln, Oxford, Sagadahoc, Waldo and York Counties. I believe this number should be increased to many times this amount, and especially in these times when the food value of the rabbit is of great importance.

BOB CATS

The winter of 1931-1932 showed a large increase in the number of bounties paid for the killing of bob cats. This was due

somewhat to the fact that the Legislature raised the bounty from \$10.00 to \$20.00 which of course made it a greater incentive for hunters to kill these animals.

Although the large amount paid out by the Department has made large inroads on the Department's funds, I am of the opinion that it would pay the State to continue this bounty.

View of One of the Many Caches of Wild Rice

DUCKS

The duck situation in the State remains practically the same as in 1929 and 1930. The Department has planted wild rice and other duck foods in practically every section of the State suitable for these birds. Most of these plantings have proven successful so that now there are many acres of available duck foods which should increase the duck supply. The Federal Government has increased the duck season by one month, but has made the opening date two weeks later than in 1930. I am of the opinion that our most satisfactory dates would be from October 1st to December 1st, and am in hopes to have this change made for the fall of 1933.

REPORTS OF LICENSEES FOR 1931

Guides

Reports received from licensed guides show that they guided 62,328½ days, guiding 4,613 residents and 9,628 non-residents, 4,537 being hunters.

Guides' Reports on Game

- 819 report deer more plentiful than last year.
- 283 report deer less plentiful than last year.
- 340 report deer same as last year.
- 1,402 report partridge more plentiful than last year.
- 75 report partridge less plentiful than last year.
- 161 report partridge same as last year.
- 391 report moose more plentiful than last year.
- 381 report moose less plentiful than last year.
- 471 report moose same as last year.

Camp Proprietors on Unorganized Townships

Reports received from licensed camp proprietors show that they entertained 3,351 resident guests and 5,644 non-resident guests, 1,018 being hunters.

Trappers

Reports received from licensed trappers show that the following fur-bearing animals were taken:

Bear.....	261	Muskrat.....	60,077
Fox.....	5,713	Weasel.....	7,333
Mink.....	4,804	Raccoon.....	1,799
Skunk.....	7,750	Bob Cat.....	383
Otter.....	180	Fisher.....	44
Sable.....	92	Beaver.....	608

Marketmen, Camp Proprietors

Reports received show that 55 deer were purchased for sale at retail to local customers, and to serve to their guests.

Dealers in Deer Skins

Reports received show that 7,204 deer skins and 204 deer heads were purchased.

Taxidermists

Reports received show following animals mounted:

Deer.....	4	Deer Skins Tanned....	61
Deer Heads.....	721	Fox.....	68
Bear.....	108	Bear Rugs.....	7
Birds.....	384	Wild Cat Rug.....	1
Fish.....	468	Porcupine.....	4
Weasel.....	11	Deer Feet.....	30
Wild Cats.....	25	Bear Skins Tanned....	6
Squirrels.....	84	Raccoon Skins Tanned..	8
Deer Foot Rack.....	1	Fox Skins Tanned....	7
Raccoon.....	1		

Fur Buyers

Reports received show that the skins of the following animals were purchased:

Bear.....	154	Otter.....	181
Lynx.....	13	Raccoon.....	4,942
Bob Cats.....	685	Skunk.....	13,856
Fox.....	7,818	Beaver.....	710
Mink.....	6,576	Fisher or Black Cat...	36
Marten or Sable.....	38	House Cat.....	25

		Pheasants.....	186

Damage Cases

The law authorizes the Department of Inland Fisheries and Game to compensate residents of the State for damage done to "growing crops and orchards" by protected wild birds and animals.

In accordance with this law, a total of \$3,378.53 was paid on 109 claims during the fiscal year ending June 30th, 1932.

About 80% of this damage was done by deer, and the remainder by skunks, raccoons and grey squirrels. The largest damage done by deer is to orchards, particularly young trees one to three years old. Next in order are potatoes and beans with many small claims for various kinds of garden truck.

Most of the damage by skunks, raccoons and grey squirrels is to corn. This crop is never touched by deer.

Some damage is done to orchards by partridges budding them during the winter and early spring. This damage, however, does not prove to be nearly as serious as is usually claimed by the orchardists at the time the damage is done.
