POPULATION ESTIMATES
for Minor Civil Divisions by County
Maine, 1982

Division of Data and Research
Bureau of Health Planning and Development
Maine Department of Human Services

December, 1983

325895

INTRODUCTION

This document continues the series of annual estimates of Maine's population, originally prepared by the Division of Research and Vital Records. Estimates of the population in five age groups are given for each minor civil division (MCD) in the State of Maine. Organized MCD's are arranged in alphabetical sequence within each county, and summaries of each county are displayed as well. Some of the unorganized MCD's are clustered as a single unit of population. The clustered MCD's follow the organized minor civil divisions.

Special acknowledgement is due to the agencies which supplied some of the input data used in the preparation of these population estimates. School enrollment data was supplied by the Department of Education and Cultural Services. Housing Unit data was supplied by the State Planning Office. County controls used in these estimates were prepared by the United States Census Bureau.

Under the general guidance of Ellen Naor, Director of the Division of Data and Research, Bureau of Health Planning and Development, this report was produced by Dale Welch, Senior Researcher. William Turner, Computer Programmer, prepared the input computer files and William Perry, Deputy Division Director, provided technical assistance and consultation in implementing the statistical methodology. The cover was designed by Bruce Armstrong and the text was typed by Sue Whitley and Sylvia Cunningham.

HIGHLIGHTS

Total Population:

The population of the State of Maine on July 1, 1982, was 1,136,199. This is an increase of 11,172 or 1.0 percent since April 1, 1980. The number of births exceeded the number of deaths by 13,965 between April 1, 1980, and July 1, 1982. The number of out-migrants exceeded the number of in-migrants by 2,793. During the 12 month period between July 1, 1981, and July 1, 1982, the natural increase was 6,431 and the net migration was 3,081 outward.

County Populations:

All counties except Aroostook, Washington, and Oxford increased in population between April 1, 1980, and July 1, 1982. The largest increase in county population was 5,546 in York County. The largest decrease was a reduction of 1,321 people in Aroostook County.

Ten of the 16 counties had a net migration outward. The largest net migration outward was 2,837 in Aroostook County. The largest net migration inward was 3,670 in York County.

Minor Civil Division Populations (MCD's):

Sixty-one percent of the 536 MCD's had an increase in population between April 1, 1980, and July 1, 1982. The largest increases in population were in the minor civil divisions of Sanford (850), Windham (692) and Limestone (641). The largest decreases in population were in Portland (-1,060), Orono (-657), and Waterville (-591).

The largest amount of net migration inward was 592, in the town of Sanford. The largest amount of net migration outward was 1,424, in the City of Portland.

Age Group Populations:

The amount and direction of change in population from April 1, 1980, to July 1, 1982, varied among the different age groups. The preschool group, age 0-4, increased by 1,841. The school age group, age 5-17, decreased by 12,662. The young adult group, age 18-44, increased by 16,780. The older adult group, age 45-64, decreased by 1,026, while the elderly, age 65+, increased by 6,239.

The age cohort who were 0-4 on July 1, 1982 had a net outward migration of 723. The age cohort who were 5-17 on July 1, 1982 had a net inward migration of 1,630. The age cohort who were 18-44 on July 1, 1982 had a net outward migration of 5,601. The age cohort who were 45-64 on July 1, 1982 had a net inward migration of 343. The age cohort who were 65 and over on July 1, 1982 had a net inward migration of 1,558.

TECHNICAL NOTES

Methodology:

The method used to produce these estimates is a component method in which the population estimate of each age cohort of each minor civil division (MCD) is equal to the 1980 census count of the cohort, plus the natural increase of that cohort, plus the estimated net migration between April 1, 1980 and July 1, 1982.

The first two components of these estimates are known data. The third component, net migration, is estimated by regression lines based on the previous decade (1970-1980). The dependent variables in this regression analysis are the migration rates of each age group in each area. The independent variables are the ratios of the difference between the actual and expected values of given symptomatic indicators of migration to the expected values. The expected values of symptomatic indicators of migration are based on United States trends. After the estimated migration rate of a given cohort of a given MCD is calculated, it is multiplied by the population base of the cohort to obtain the estimated net migration.

Ten variables were tested for use as symptomatic indicators of migration in this methodology. They were births, deaths, AFDC children, housing units, school enrollment, newlyweds, covered employment, old age assistance recipients, military enlistments and voter registration. The best three variables for each age group were selected for use as estimators of migration. Housing units, births and newlyweds were selected for the age cohort 0-4. School enrollment, births, and housing units were used for the age cohort 5-17. School enrollment, housing units, and newlyweds were the best for the age cohort 18-44. School enrollment, newlyweds, and deaths were used for the age cohort 45-64. School enrollment, deaths and births were selected for the age cohort 65+.

A more detailed description of the methodology is presented in the resource series titled, "Methodology for Age Group Regression Population Estimates for Minor Civil Divisions",* published by the Bureau of Health Planning and Development.

Accuracy of Estimates:

Even if one had the perfect methodology for estimating population, the quality of the estimates is limited by the quality of the data used to prepare them. The most important symptomatic indicator of migration is the school enrollment data. There are a number of towns in which certain private schools did not report 1982 school enrollment data to the Department of Education and Cultural Services. We used estimates of this missing school data based on the last known enrollment of a missing school. Using this estimated private school data may affect the quality of the estimates of some towns. This is especially true if there was a shift between public and private school enrollment of a town with missing private school data.

In future years, it is hoped that more complete reporting of private school enrollment can be obtained in order to optimize the quality of population estimates.
