POPULATION ESTIMATES  
for Minor Civil Divisions by County  
Maine, 1986

Office of Data, Research, and Vital Statistics  
Maine Department of Human Services

Produced under Appropriation No. 1305-1065

October, 1987

This document continues the series of annual estimates of Maine's population, prepared and published by the Office of Data, Research, and Vital Statistics. Estimates of the population in five age groups are given for each minor civil division (MCD) in the State of Maine. Organized MCDs are arranged in alphabetical sequence within each county, and summaries of each county are displayed as well. Some of the unorganized MCDs are clustered as a single unit of population. The clustered MCDs follow the organized minor civil divisions.

Special acknowledgement is due to the agencies which supplied some of the input data used in the preparation of these population estimates. Religious school enrollment data were supplied by each religious school. Non-religious school enrollment data were supplied by the Department of Education and Cultural Services. Housing Unit data were supplied by the Bureau of Taxation. County controls used in these estimates were prepared by the United States Census Bureau.

Under the general guidance of Ellen Naor, Director of the Office of Data, Research, and Vital Statistics, this report was produced by Dale Welch, Senior Researcher. William Turner, Computer Programmer, prepared the input computer files. The text was typed by Sue Whitley and Sylvia Cunningham.

## HIGHLIGHTS

### Total Population:

The estimated population of the State of Maine on July 1, 1986, was 1,173,731. This is an increase of 48,688 or 4.3 percent since April 1, 1980. The number of births exceeded the number of deaths by 36,904 between April 1, 1980, and July 1, 1986. The number of in-migrants exceeded the number of out-migrants by 11,784. During the 12 month period between July 1, 1985, and July 1, 1986, the natural increase was 5,665 and the net migration was 4,217 inward.

### County Populations:

All counties except Aroostook and Washington increased in population between April 1, 1980, and July 1, 1986. The largest increase in county population was 19,033 in York County. The largest decrease was a reduction of 3,443 people in Aroostook County.

Ten of the 16 counties had a net migration inward. The largest net migration outward was 7,226 in Aroostook County. The largest net migration inward was 13,844 in York County.

### Minor Civil Division Populations (MCDs):

The State of Maine contains 913 Minor Civil Divisions. In this report, certain unorganized MCDs have been clustered, reducing the number of sub-divisions to 536. Both clustered and unique sub-divisions are referred to as MCDs.

Sixty-seven percent of the 536 MCDs had an increase in population between April 1, 1980, and July 1, 1986. The largest increases in population were in the minor civil divisions of Sanford (2,528), Windham (1,917), and Limestone (1,540). The largest decreases in population were in Lewiston (-1,510), Orono (-1,484), and Waterville (-1,193).

The largest amount of net migration inward was 2,528, in the town of Sanford. The largest amount of net migration outward was 2,155, in the city of Lewiston.

The largest amount of natural increase was 1,509 in the town of Limestone. The smallest amount of natural increase was -106 in the town of Camden.

#### Age Group Populations:

The amount and direction of change in population from April 1, 1980, to July 1, 1986, varied among the different age groups. The preschool group, age 0-4, increased by 6,654. The school age group, age 5-17, decreased by 19,889. The young adult group, age 18-44, increased by 40,838. The older adult group, age 45-64, increased by 1,286, while the elderly, age 65+, increased by 19,799.

The age cohort who were 0-4 on July 1, 1986 had a net inward migration of 2,319. The age cohort who were 5-17 on July 1, 1986 had a net inward migration of 7,679. The age cohort who were 18-44 on July 1, 1986 had a net outward migration of -11,477. The age cohort who were 45-64 on July 1, 1986 had a net inward migration of 4,498. The age cohort who were 65 and over on July 1, 1986 had a net inward migration of 8,765.

## TECHNICAL NOTES

### Methodology:

The method used to produce these estimates is a component method in which the population estimate of each age cohort of each minor civil division (MCD) is equal to the 1980 census count of the cohort, plus the natural increase of that cohort, plus the estimated net migration between April 1, 1980 and July 1, 1986.

The first two components of these estimates are known data. The third component, net migration, is estimated by regression lines based on the previous decade (1970-1980). The dependent variables in this regression analysis are the migration rates of each age group in each area. The independent variables are the ratios of the difference between the actual and expected values of given symptomatic indicators of migration to the expected values. The expected values of these indicators of migration are based on United States trends. After the estimated migration rate of a given cohort of a given MCD is calculated, it is multiplied by the population base of the cohort to obtain the estimated net migration.

Ten variables were tested for use as symptomatic indicators of migration in this methodology. They were births, deaths, AFDC children, housing units, school enrollment, newlyweds, covered employment, old age assistance recipients, military enlistments and voter registration. The best three variables for each age group were selected for use as estimators of migration. Housing units, births and newlyweds were selected for the age cohort 0-4. School enrollment, births, and housing units were used for the age cohort 5-17. School enrollment, housing units, and newlyweds were the best for the age cohort 18-44.

School enrollment, newlyweds, and deaths were used for the age cohort 45-64. School enrollment, deaths and births were selected for the age cohort 65+.

A more detailed description of the methodology is presented in the resource series report titled, "Methodology for Age Group Regression Population Estimates for Minor Civil Divisions",\* published by the Office of Data, Research, and Vital Statistics.

#### Accuracy of Estimates:

Even if one had the perfect methodology for estimating population, the quality of the estimates is limited by the quality of the data used to prepare them. The most important symptomatic indicator of migration is the school enrollment data. In previous years, there were a number of towns in which certain private schools did not report school enrollment data to the Department of Education and Cultural Services. We used estimates of this missing school data based on the last known enrollment of a missing school. Beginning with the 1985 estimates, however, we have surveyed religious schools annually to obtain their school enrollment by residence of the student. The use of these survey data has improved the quality of our estimates by including more complete information.

There are no data available for a precise measurement of the quality of these estimates. However, we have attempted to assess their quality by comparing these 1986 MCD estimates ("State Estimates") with those made by the U.S. Census Bureau ("Federal Estimates"). Good agreement between the State and Federal Estimates is not positive proof of the high quality or accuracy of either estimate. However, agreement certainly increases our confidence in their accuracy, especially since the two methods of estimation are very dissimilar. There were only five MCDs for which the difference was so great that we surmise that either the State Estimate or the Federal Estimate, or both, are "unacceptable", i.e., too inaccurate for most uses. Those MCDs are Limestone, Veazie, Hampden, Appleton and Phillips.

\*Welch, D. "Methodology for Age Group Regression Population Estimates for Minor Civil Divisions," Resource Series No. 9. Augusta: Maine Department of Human Services, February, 1983.

There were also 21 MCDs with "acceptable" estimates, although the difference between the State and Federal Estimates was still rather large. It should be emphasized that this analysis considers only the degree of agreement or accordance between the State and Federal Estimates of the population of an MCD; we have no way to determine which estimate is more correct.

This analysis of the quality of the estimates is based on an article in the American Statistician\* which presents a measure called the Maximum Ratio (M). In our application, M is the absolute value of the difference between the State and Federal Estimates for an MCD, divided by the smaller of the two estimates. The concept of the index of accordance, defined as  $M/(M+2)$ , is also presented in this article where it is referred to as  $\alpha$  (the Greek letter alpha). We feel that "Index of Accordance" is a more informative name for our purposes. The Index of Accordance is equal to  $M/(M+2)$ .

We have developed a model to use, with the Index of Accordance, as a benchmark to assess the quality of population estimates. If the Index of Accordance (I) is less than or equal to the benchmark (B), i.e.  $I/B$  is not greater than 1.00, we consider the estimate to be of acceptable accuracy.

The table on the next page shows the 26 MCDs with an I/B ratio greater than .75. The Index of Accordance is equal to  $M/(M+2)$ , where M equals the absolute value of the error of estimate ratio, (State Estimate minus Federal Estimate)  $\div$  (Minimum of State Estimate and Federal Estimate). The benchmark is calculated from the equation  $B = .128t/2\text{Log}P_{80}$ , where t = time in years between the census date and the date of estimate and  $P_{80}$  is the 1980 census count.
