## INTRODUCTION

---

This report contains a summary of the Vital Statistics of the State of Maine for the calendar year 1965. Births and deaths are tabulated for each county and for 49 urban cities and towns. The 49 urban cities and towns selected for separate tabulation are those places designated as urban in the 1960 Census of Population.

### ALLOCATION OF VITAL EVENTS

The statistics on births and deaths in this report refer to residents of Maine only, regardless of whether or not the birth or death actually occurred in Maine. Statistics on marriages and divorces in this report include nonresidents as well as residents of Maine who marry or are divorced in the State.

Births are allocated to the usual residence of the mother and deaths to the usual resident of the deceased. This information is obtained for the certificate by the physician, hospital record librarian, funeral director, or other person responsible for completing the certificate of birth or death. The practice of allocating births and deaths to usual place of residence was initiated in 1935. This method of allocation is made possible by the exchange of transcripts of nonresident births and deaths with other states and Canada.

Marriages and divorces are allocated to the place in Maine where the marriage ceremony was performed or where the divorce decree was granted, rather than the place of residence.

### FACTORS AFFECTING ACCURACY

A number of factors operate to produce certain slight inaccuracies in this report. Some of the more important of these factors are outlined below:

- (1) Completeness of Registration: A birth certificate test conducted in 1950

indicated that about one percent of births in Maine are not recorded. In addition to unrecorded vital events, others may not be included in this report by reason of failure of the person required to report the event to make a timely report, or failure of a municipal clerk to make a timely report to the State Registrar, or failure of other states to make timely exchanges of nonresident transcripts of births and deaths.

(2) Errors in Data: Data in this report are based upon original certificates of births and deaths, copies of original certificates of marriages prepared by city and town clerks, and abstracts of decrees of divorces prepared by the clerks of courts. Errors in data may be introduced by persons giving information for the original certificate, persons involved in the actual preparation of the original certificate, or persons involved in the preparation of the copies or abstracts of the original certificates which are submitted to the State Registrar.

#### POPULATION ESTIMATES

The estimate of population of the State on July 1, 1965 which appears in the report is prepared by the U. S. Department of Commerce, Bureau of Census. Estimates of the populations of the counties are prepared by the Division of Vital Statistics.

The population of counties are independent estimates prepared for each county. These estimates are computed by a method which assumes the population is directly proportional to the total number of vital events reported. The county population estimates prepared in this manner are then adjusted by a constant factor so that the sum of the population of all counties equals the population of the entire State as estimated by the Bureau of the Census.

#### MORTALITY CLASSIFICATION

The International Conference for the 7th Revision of the International Lists of Diseases and Causes of Death, was held in Paris under the WHO auspices in 1955. The recommendations of this conference were adopted by the 9th World Health Assembly in 1956, and the resulting new International Statistical Classification of Diseases,

Injuries, and Causes of Death was placed in use in Maine and throughout most of the World on January 1, 1958.

The 7th Revision of the International Statistical Classification consists of a list 612 categories of diseases and morbid conditions, plus 153 categories for classification of the external cause of injury, and 189 categories for the characterization of injuries according to the nature of lesion.

Under the 7th Revision the method for selecting the cause of death for statistical purposes remained the same as the method under the 6th Revision. The 6th Revision, introduced in 1949, instituted a method whereby the physician in attendance at death indicates the disease or morbid condition which he considers to be the underlying cause of death. The underlying cause is defined as "(a) the disease or injury which initiated the train of events leading directly to death, or (b) the circumstances of the accident which produced fatal injury."

Two abridged lists of causes of death are presented in this report. Deaths by selected age groups are tabulated in an abridged list of 254 causes and deaths by residence are tabulated in an abridged list of 65 causes.

#### RATES

Birth rates and crude mortality rates are expressed as the number of births or deaths per 1,000 population. Mortality rates attributed to specific diseases are expressed as the number of deaths per 100,000 population.

Infant mortality rates are expressed as the number of deaths per 1,000 live births. Maternal mortality rates are expressed as the number of deaths per 10,000 live births.

## POPULATION

The population of Maine was estimated to be 993,000 on July 1, 1965. This represents a net gain in population of 24,000 or 2.5 percent, over the number of inhabitants enumerated in the 1960 census. Total civilian population was estimated to be 975,000 on July 1, 1965. This represents a net gain of 25,000 in civilian population since April 1, 1960, or a net gain of 2.6 percent. The natural increase in total population between April 1, 1960 and July 1, 1965 was 60,000 and the estimated net outward migration was 36,000.

## LIVE BIRTHS

There were 19,796 resident live births registered in Maine in 1965. This was 6.6 percent fewer births than were registered in 1964 and marks the fourth successive year that the birth rate has decreased. The birth rate was 19.9 per 1,000 population. This is the lowest yearly birth rate since 1945.

### SEX

The number of male live births was 10,138 and the number of female live births was 9,658. The sex ratio of live births was 105.0 male live births for every 100.0 female live births.

### PLURAL BIRTHS

There were 182 plural births in which at least one child was born alive. 1965 plural births consisted of 181 twin and 1 triplet birth.

### RACE

Only 1.3 percent of all resident live births in 1965 were nonwhite. The total number of nonwhite births in 1965 was 248. This is a decrease of 17.1 percent over the number of resident nonwhite live births in 1964.

The largest nonwhite group was Negroes, who gave birth to 126 live born children. American Indians gave birth to 76, Japanese gave birth to 17, and persons of other nonwhite races gave birth to 29 live born children.

### LEGITIMACY

There were 1,053 illegitimate births to mothers who were Maine residents in 1965. Illegitimate live births represented 5.3 percent of all resident live births. 1965 marks the sixth successive year that the percentage of illegitimate live births has increased.

### HOSPITAL BIRTHS

The number of resident live births in hospitals and licensed maternity homes in 1965 was 19,693 or 99.5 percent of all resident live births.

## FETAL DEATHS

The number of resident fetal deaths was 346, which was 6.2 percent less than 1964. The fetal death rate was 17.5 per 1,000 live births as compared with a fetal death rate of 17.4 in 1964.

### GESTATION

The following table shows resident fetal deaths in 1965 by length of gestation and percent change in each group from fetal deaths reported in 1965.

TABLE 2,  
FETAL DEATHS BY LENGTH OF GESTATION  
MAINE, 1965

Gestation in weeks	Fetal Deaths	Percent
		Change from 1964
Total	346	- 6.2
Under 13 weeks	13	+ 85.7
13 - 19 weeks	19	- 29.6
20 - 27 weeks	49	- 2.0
28 weeks and over	189	- 3.6
Not reported	76	- 14.6

## GENERAL MORTALITY

There were 10,778 deaths of Maine residents in 1965 and the crude mortality rate was 10.9. This is a 0.8 and 1.3 percent decrease in number and rate respectively over 1964.

### SEX

The number of resident male deaths was 5,913 and the number of resident female deaths was 4,865. The estimated death rate among males was 12.0 per 1,000 male population and among females was 9.9 per 1,000 female population.

### INFANT DEATHS

There were 443 infant deaths in Maine during 1965 and the infant mortality rate was 22.4. This was an 11.0 and 4.7 percent decrease in number and rate respectively over 1964. 1965 marks the fourth successive year with a decrease in the infant mortality rate. The infant mortality rate has decreased 11.1 percent since 1960, 28.2 percent since 1950, 57.7 percent since 1940 and 70.3 percent since 1930.

There were 334 neonatal deaths (infant deaths during the first 4 weeks of life) in 1965 and the neonatal mortality rate was 16.9 per 1,000 live births. The neonatal mortality rate has decreased 9.1 percent since 1960, 23.2 percent since 1950, 50.3 percent since 1940 and 59.3 since 1930. 1965 marks the fourth successive year that the neonatal death rate has decreased.

## PERINATAL MORTALITY

The estimated perinatal mortality rate in 1965 was 31.8 perinatal deaths per 1,000 live births and fetal deaths of 20 weeks or more gestation.

The perinatal mortality rate is based on the following formula:

Fetal deaths 20 weeks or more + neonatal deaths

$$\frac{\text{Fetal deaths 20 weeks or more} + \text{neonatal deaths}}{\text{Total live births} + \text{fetal deaths 20 weeks or more}} \times 1000$$

The 1965 perinatal mortality rate is based on an estimated 305 fetal deaths of 20 or more weeks gestation and 334 neonatal deaths.

## MATERNAL MORTALITY

There were 4 maternal deaths in Maine in 1965 and the maternal mortality rate was 2.0 per 10,000 live births. The maternal mortality rate has decreased 4.8 percent since 1960, 64.3 percent since 1950, 95.1 percent since 1940 and 97.2 percent since 1930.

## MARRIAGES

There were 8,726 marriages in Maine in 1965. This was 557 more than 1964 and marks the sixth successive year that the number of marriages has increased. The marriage rate was 8.8 per 1,000 population. The marriage rate has increased 8.9 percent since 1960, but is 6.4 percent less than the 1950 marriage rate. 1965 marks the fourth successive year that the marriage rate has increased.

### PREVIOUS MARITAL STATUS

There were 6,194 marriages in Maine in 1965 in which both the bride and groom were marrying for the first time. This was 332 less than the number of first marriages in 1964. 78.0 percent of the grooms and 78.2 percent of the brides were marrying for the first time.

### RESIDENCE OF PARTIES

The number of resident brides marrying in 1965 was 8,147 and the number of resident grooms was 7,201. Residents of all the states, except Alaska and South Dakota, The Virgin Islands, Canada and several other foreign countries were married in Maine in 1965.

## DIVORCES and ANNULMENTS

The Superior Court in Maine granted 2,502 divorces during the calendar year 1965. This was 4.1 percent more than the number of divorces granted in 1964. The crude divorce rate was 2.6 per 1,000 population. 1965 marks the fourth successive year that the divorce rate has increased.

The number of marriages annulled in 1965 was 19.

### SEX OF LIBELANT

It was the wife who most frequently sought divorce. Divorces were granted to the wife in 1,941 or 77.6 percent of all divorcees granted in Maine in 1965.

#### LEGAL GROUNDS FOR DECREE

Cruelty was the legal grounds for decree in 95.2 percent of divorces granted in Maine in 1965. Cruelty includes "cruel and abusive treatment" and "extreme cruelty".

#### DURATION OF MARRIAGE

The median duration of marriage before divorce among 1965 divorces was 4.3 years. The second year of marriage was the peak year during which marriages were ended by divorce.

#### MINOR CHILDREN

The divorced couple had one or more minor children in 1,858 or 74.3 percent of 1965 divorces. One divorced couple had 12 minor children.

## LEADING CAUSES of DEATH

In the following table, "Life Lost" is based on the United States 1964 life expectancy of 70.2 years. Hence, the death of a person 60 years of age represents a total of 10.2 years of life lost. "Years of life lost" is a much better indicator of wasted human life than is the death rate or percent of total deaths. Should not the death of a child receive more weight than the death of an aged person?

Heart Disease is the leading cause of death in each instance, but it causes only 20.8 percent of the total life lost compared to 41.7 percent of the total deaths. The relative position of Malignant Neoplasms is about the same with each statistic. Vascular Lesions (CNS) cause 11.2 percent of total deaths but only 3.7 percent of total life lost. Accidents cause only 4.5 percent of total deaths but 13.5 percent of total life lost. Certain diseases of early infancy cause only 2.6 percent of total deaths but 17.2 percent of total life lost.

The year 1965 was the first time that pulmonary emphysema has been in the leading causes of death in Maine.
