23. Reported Cases of Selected Communicable Diseases by Month.....	57

INTRODUCTION

This report contains a summary of the Vital Statistics of the State of Maine for the calendar year of 1970. Births are tabulated for each county and all minor civil divisions and deaths are tabulated for each county and 45 selected minor civil divisions.

ALLOCATION OF VITAL EVENTS

The statistics on births in this report refer to residents of Maine only, regardless of whether or not the birth actually occurred in Maine. With the exceptions of Tables 4 and 11, death statistics also refer to residents of Maine only. Statistics on marriages and divorces in this report include nonresidents as well as residents of Maine, who marry or are divorced in the state.

Births are allocated to the usual residence of the mother and deaths to the usual residence of the deceased. This information is obtained for the certificate by the physician, hospital record librarian, funeral director, or other person responsible for completing the certificate of birth or death. The practice of allocating births and deaths to usual place of residence was initiated in 1935. This method of allocation is made possible by the exchange of transcripts of nonresident births and deaths with other states and Canada.

Marriages and divorces are allocated to the place in Maine where the marriage ceremony was performed or where the divorce decree was granted, rather than the place of residence.

FACTORS AFFECTING ACCURACY

Several factors may produce certain slight inaccuracies in this report.

Some of the more important of these factors are outlined below:

(1) Completeness of Registration: A birth certificate test conducted in 1950 indicated that about one percent of births in Maine are not recorded. In addition to unrecorded vital events, others may not be included in this report by reason of failure of the person required to report the event to make a timely report, or failure of a municipal clerk to make a timely report to the State Registrar, or failure of other states to make timely exchanges of nonresident transcripts of births and deaths.

(2) Errors in Data: Data in this report are based upon original certificates of births and deaths, copies of original certificates of marriages prepared by city and town clerks, and abstracts of decrees of divorces prepared by the clerks of courts. Errors in data may be introduced by persons giving information for the original certificate, persons involved in the actual preparation of the original certificate, or persons involved in the preparation of the copies or abstracts of the original certificates which are submitted to the State Registrar.

POPULATION ESTIMATES

Population figures appearing in this report are taken from the 1970 U. S. Census of Population for Maine. Natural increase is the difference between the number of resident live births and resident deaths for a given period of time. Net migration is the difference between inward and outward migration for a given period of time.

MORTALITY CLASSIFICATION

The mortality classification used in this report is the 8th Revision of the International Statistical Classification, consisting of a list of 671 categories of diseases and morbid conditions, plus 182 categories for classification of the external cause of injury, and 187 categories for the characterization of injuries according to the nature of lesion.

Under the 8th Revision, the method for selecting the cause of death for statistical purposes remained the same as the method under the 6th Revision. The 6th Revision, introduced in 1949, instituted a method whereby the physician in attendance at death indicates the disease or morbid condition which he considers to be the underlying cause of death. The underlying cause is defined as "(a) the disease or injury which initiated the train of events leading directly to death, or (b) the circumstances of the accident which produced fatal injury."

Two abridged lists of causes of death are presented in this report. Deaths by selected age groups are tabulated in an abridged list of 282 causes and deaths by residence are tabulated in an abridged list of 69 causes.

RATES

Birth rates and crude mortality rates, unless otherwise specified, are expressed as the number of births or deaths per 1,000 population. Mortality rates attributed to specific diseases are expressed as the number of deaths per 100,000 population. Infant mortality rates are expressed as the number of deaths per 1,000 live births. Maternal mortality rates are expressed as the number of deaths per 10,000 live births.

POPULATION

The population of Maine, according to the 1970 U. S. Census Report, was 993,663. This figure represents a net gain of 24,398, or 2.5 percent more than the number of inhabitants enumerated in the 1960 U. S. Census Report. The civilian population was 981,560, representing a net gain of 31,330, or 3.3 percent since 1960. The greater increase of civilian population over general population reflects the decrease in military personnel during the 1960-1970 intercensal period. Military personnel decreased by 6,932, or 36.4 percent.

All, but five counties, showed a net gain in population since 1960. Those registering the greastest increases were York, up 12.2 percent, Franklin, 11.8 percent, and Lincoln, 11.0 percent. The five counties registering decreases were Aroostook, down 11.3 percent, Washington, 9.3 percent, Piscataquis, 6.3 percent, Oxford, 2.0 percent, and Penobscot, 0.8 percent.

Despite the general population increase in Maine from 1960-1970, it is evident that there was a substantial net migration out of the state. Resident births, less resident deaths for the 1960-1970 intercensal period, shows the natural increase of 92,772 to be much greater than the actual increase of 24,398. The difference of 68,374 reflects the net outward migration from the state.

All, but four counties, had a net outward migration. Aroostook had the greatest net outward rate of 250.2, per 1000 inhabitants, followed by Washington at 129.5 and Penobscot at 128.4. Lincoln had the largest net inward migration with a rate of 71.0, per 1000 inhabitants, followed by York at 38.0, Hancock at 20.1 and Franklin at 16.7.

There was a net outward migration, statewide, in all age groups, except (60-64) and (65-74). The highest rate of net outward migration was in age group (20-24) with a rate of 197.8 per 1000 inhabitants, followed by age group (25-34) at 177.6. These two age groups comprised 56.1 percent of the net outward migration during the 1960-1970 intercensal period.

POPULATION AND NET MIGRATION BY COUNTIES

MAINE 1960-1970

COUNTY	1970 Pop.	1960 Pop.	Per cent change	Natural increase	Net migration	Net migration per 1,000 Pop.

* Live births during intercensal period 7

LIVE BIRTHS

There were 17,837 resident live births registered in Maine in 1970. This is 2.7 percent more births than were registered in 1969, and marks the second successive year that the birth rate has increased following a six year decrease since 1962. The birth rate was 18.0 per 1,000 population. This is a higher rate than in 1969 but lower than in any year previous to 1967.

SEX

The number of male live births was 9,116 and the number of female live births was 8,721. The sex ratio of live births was 104.5 male live births for every 100.0 female live births.

PLURAL BIRTHS

In 1970, there were 365 children born alive in plural births.

RACE

Only 1.3 percent of all resident live births in 1970 were nonwhite. The total number of nonwhite births in 1970 was 229. This is an increase of 9.0 percent of the number of resident nonwhite live births in 1969.

The largest nonwhite group was American Indians, who gave birth to 81 live born children. Negroes gave birth to 77, and persons of other non-white races gave birth to 71 live born children.

LEGITIMACY

There were 1,388 illegitimate births to mothers who were Maine residents in 1970. Illegitimate live births represented 7.8 percent of all resident live births. This marks the eleventh successive year that the percentage of illegitimate live births has increased.

HOSPITAL BIRTHS

The number of resident live births in hospitals and licensed maternity homes in 1970 was 17,762 or 99.6 percent of all resident live births.

FETAL DEATHS

The number of resident fetal deaths in 1970 was 246, which was 20.6 percent more than the number in 1969. The fetal death rate was 13.8 per 1,000 live births. This is the second lowest fetal death rate in the history of the state.

GESTATION

The following table shows resident fetal deaths in 1970 by length of gestation and percent of total in each group. Unreported gestation periods have been allocated for this table.

FETAL DEATHS BY LENGTH OF GESTATION

MAINE, 1970

Gestation in weeks	Fetal Deaths	Percent of Total
Total	246	100.0
Under 13 weeks	6	2.5
13 - 19 weeks	19	7.7
20 - 27 weeks	49	19.9
28 weeks and over	172	69.9

GENERAL MORTALITY

There were 11,066 deaths of Maine residents in 1970 and the crude mortality rate was 11.1. This is a 1.5 percent increase in number and an 0.9 percent increase in rate from 1969.

SEX

In 1970 the number of resident male deaths was 6,068 and the number of resident female deaths was 4,998. The estimated death rate among males was 12.5 per 1,000 male population and among females was 9.8 per 1,000 female population.

INFANT DEATHS

There were 373 infant deaths in Maine during 1970 and the infant death mortality rate was 20.9 per 1,000 live births. This was a 9.1 percent increase in number and 6.1 percent increase in rate over 1969. The infant mortality rate has decreased 17.1 percent since 1960, 33.0 percent since 1950, 60.5 percent since 1940, and 72.3 percent since 1930.

There were 287 neonatal deaths (infant deaths during the first four weeks of life) in 1970 and the neonatal mortality rate was 16.1 per 1,000 live births. This was an increase of 5.2 percent over 1969.

PERINATAL MORTALITY

The estimated perinatal mortality rate in 1970 was 28.1 perinatal deaths per 1,000 live births and fetal deaths of twenty weeks or more gestation.

The perinatal mortality rate is based on the following formula:

$$\frac{\text{Fetal deaths 20 weeks or more} + \text{neonatal deaths}}{\text{Total live births} + \text{fetal deaths 20 weeks or more}} \times 1000$$

The 1970 perinatal mortality rate is based on 221 fetal deaths of 20 or more weeks gestation and 287 neonatal deaths.

MATERNAL MORTALITY

There were 3 maternal deaths in Maine in 1970 and the maternal mortality rate was 1.7 per 10,000 live births, up from a rate of 1.2 in 1969.

MARRIAGES

There were 10,975 marriages in Maine in 1970. This was 547 more than in 1969, and marks the eleventh successive year that the number of marriages has increased. The marriage rate was 11.0 per 1,000 population. 1970 marks the ninth successive year that the marriage rate has increased, and the total number of marriages is the highest since 1946.

PREVIOUS MARITAL STATUS

There were 7,431 marriages in Maine in 1970 in which both the bride and groom were marrying for the first time. This was 250 more than the number of first marriages in 1969. 75.7 percent of the grooms and 75.8 percent of the brides were married for the first time.

DIVORCES AND ANNULMENTS

There were 3,841 divorces granted in Maine during the calendar year 1970. This was 13.8 percent more than the number of divorces granted in 1969. The crude divorce rate was 3.9 per 1,000 population. 1970 marks the ninth successive year that the divorce rate has increased. The number of marriages annulled in 1970 was 13.

SEX OF LIBELANT

The wife was granted the divorce in 3,147 or 81.9 percent of all the divorces granted.

LEGAL GROUNDS FOR DECREE

Cruelty was the legal grounds for decree in 97.8 percent of all divorces granted in Maine in 1970. Cruelty includes "cruel and abusive treatment" and "extreme cruelty".

DURATION OF MARRIAGE

The median duration of marriage before 1970 divorces was 6.1 years. The third year of marriage was the peak year during which marriages were ended by divorce.

MINOR CHILDREN

The divorced couple had one or more minor children in 2,600 or 67.7 percent of 1970 divorces. Sixteen divorced couples had 8 or more children.

LEADING CAUSES OF DEATH

In the following table, "Life Lost" is based on expectation of life from the 1968 United States Life tables for white population. The death of an infant represents a total of 71.1 years "life lost" and the death of a person 85 years of age represents 4.7 years of "life lost".

When one examines the leading causes of death in terms of "life lost" rather than total deaths, an entirely different picture is presented. "Certain diseases of early infancy" which caused only 1.9 percent of total deaths, caused 8.7 percent of the total "life lost" in 1970 and jumped from seventh place in total deaths to fourth place in total "life lost". Congenital Anomalies jumped from twelfth place in total deaths to seventh place in "life lost". Accidents caused only 5.0 percent of total deaths but 10.9 percent of total "life lost". Diseases of the heart caused 41.1 percent of total deaths but only 29.1 percent of total "life lost".

The largest increases in the "life lost" rate over 1969 were congenital anomalies which increased 13.0 percent and cirrhosis of the liver which increased 11.5 percent. Malignant neoplasms increased 8.6 percent. The largest decrease in "life lost" rate was diabetes which decreased 14.3 percent. Cerebrovascular disease decreased by 10.2 percent.

ACCIDENTS

Accidents, occurring in Maine in 1970, accounted for 592 deaths. Of these accidents, 48.5 percent happened on Maine's streets and highways and 22.8 percent happened at home. In 8.4 percent of the accidents, the victim was considered to be working, when the accident happened.

The state death rate for accidents occurring in Maine was 59.6 deaths per 100,000 population. Only Kennebec county had a significantly lower rate. Three counties, Hancock, Lincoln and Piscataquis, had significantly higher rates than 59.6 in 1970.
