maine innovation index

March 2008

Prepared by:

JOHN ELIAS BALDACCI
GOVERNOR

STATE OF MAINE
DEPARTMENT OF
ECONOMIC AND COMMUNITY DEVELOPMENT
59 STATE HOUSE STATION
AUGUSTA, MAINE
04333-0059

JOHN RICHARDSON
COMMISSIONER

January 2008

The *2008 Maine Innovation Index* continues a tradition of matching our state's investments in research and development with annual, independent evaluations of our progress on key indicators. This report compares Maine's performance with the United States, the New England states and the other EPSCoR states in order to show our competitive position over time. Using longitudinal data dating back to 1996, the *Index* allows policy makers to see the impact of the renewed investment that Maine has made in innovation over the past ten years.

Recently, Maine's independent evaluation was cited by the National Governor's Association Center for Best Practice as one of three rigorous and effective performance management systems being conducted nationally. We know that the results of this evaluation effort have been essential to making adjustments to the state's innovation policy in the past few years.

This year's data will also prove to be informative and influential. We can see that in some areas, our performance continues to be strong, such as the level of research and development being conducted by our non-profit research laboratories and the performance of our 8th graders on math and science. We are gaining ground in academic and industry performance of research and development, very important indicators of the health of our innovation economy. And, we see continued weaknesses in patents and in venture capital, both of which need to be addressed.

Maine's future depends upon transforming our tradition of Yankee ingenuity into innovation-based economic strategies to support our traditional industries as well as emerging ones. This takes patience and a long-term sustained effort. Tools like this *Index* allow us to measure progress on the way to these goals.

John Richardson
Commissioner

INTRODUCTION & SUMMARY

Maine's economy has expanded from its traditional bases of forestry, fishing, agriculture, tourism and manufacturing to include an increasing influence from business, financial and health services, information technologies, biomedical technologies, advanced materials, aquaculture, and advanced manufacturing. Furthermore, Maine's economy like the global economy is becoming increasingly driven by entities and individuals that operate at innovative crossroads of these sectors. Maine's future success in growing its economic base and increasing the standard of living of its people lies in the ability of its companies, workers, and citizens to foster this innovation

The Council of Competitiveness through its National Innovation Initiative describes innovation as the "intersection of invention and insight, leading to the creation of social and economic value"¹. The importance of innovation in driving Maine's future economic growth can not be overstated. According to the Council of Competitiveness innovation is "the single most important factor in determining America's success through the 21st Century. It will drive productivity, standard of living, and leadership in the global economy"².

The Office of Innovation (OOI) was established within the Department of Economic and Community Development to advance Maine's economic well-being and expand employment opportunities by encouraging and coordinating the State's R&D activities and fostering collaboration among its higher educational and nonprofit research institutions and the business community. It is the responsibility of OOI to regularly plan for and report on progress made by the State in these regards.

Maine's Innovation Index 2008 is a compilation of 25 indicators measuring Maine's economic capacity and progress toward competing in an innovation-driven economy. The indicators are organized into five categories representing key components of an innovation-based economy:

- **Research and Development Capacity**
- **Innovation Capacity**
- **Employment & Output Capacity**
- **Education Capacity**
- **Connectivity Capacity**

Research and Development Capacity - Research forms the basis for the successful development of new products, processes and services. The section on research and development (R&D) capacity provides measures of the dollar amount of R&D performance in the state as a percent of gross state product. The measures capture performance (as measured by spending) by the various types of entities engaged in R&D, including industry, academic institutions, and not-for-profit laboratories. Additionally, R&D contributions by the federal government and the state are considered within the R&D capacity section.

Innovation Capacity - Innovation is the continuous process of generating and applying new ideas that lead to commercialization of new products, processes and services. It is this commercialization process

that leads to the creation of new jobs and ultimately increased wealth throughout the state. The innovation capacity section of this report assesses Maine's potential for generating innovation by measuring grants obtained through the Federal Small Business Innovation Research program, venture capital attracted, patents issued, and entrepreneurial activity.

Employment & Output Capacity - The depth and breadth of Maine's highly skilled workforce is perhaps the most important indicator of our ability to grow and sustain an innovation-driven economy. For Maine to remain competitive in today's marketplace we need to assure that technology and research-intensive businesses and institutions have a thick labor market of skilled and highly educated workers. With a skilled and knowledge driven labor market Maine can improve its ultimate economic outcomes: gross state product and per capita income. This section includes the measures of high technology employment and business establishments, science and engineering occupations and PhD's in the workforce, gross state product, and per capita income.

Education Capacity - Maine's economic future will depend heavily on the quality of today's education systems. Since knowledge is the raw material of innovation, our education systems must produce students capable of organizing and analyzing information, communicating effectively, and operating in both collaborative and independent settings. As a state, our success relies on our ability to increase access to a quality, life-long education system for all Maine residents. Over the long-term, it is our education capacity that will serve as the foundation for our employment capacity. Furthermore, technology and innovation based businesses rely on workers with solid foundations in math and science as well as advanced knowledge in science and engineering fields. The education capacity section includes the indicators of science and math skills of 8th grade students, the chance for college by age 19, science and engineering graduate enrollments and degrees awarded, and the percent of population 25 and older with bachelor's degree or more.

Connectivity Capacity - The development and deployment of information technology (IT) has profoundly impacted the way we access and use information, and is defining the way we learn, work, and communicate. The section on connectivity capacity measures Maine's ability to provide IT infrastructure to enable businesses, educators, students and citizens to easily access information. Connectivity capacity indicators include high-speed Internet access, household Internet connectivity, and K-12 students per Internet connected classroom computer.

Within each capacity area there are two types of indicators. The first measures the relative strength of the "raw materials" essential to the growth of Maine's innovation economy. Examples include: R&D spending, education attainment, venture capital investments, and Internet connectivity – all necessary inputs that serve as the foundation for innovation-based economic growth. The second type of indicator assesses the performance of Maine's innovation-driven economic growth by measuring key outputs and products. Examples include: patents issued, technology-business establishments, and technology employment. These indicators tell us how Maine's innovation economy is performing and the degree to which inputs are leading to desired outputs and outcomes. In addition to the 25 key indicators, related sub-indicators further describe Maine's performance in growing and sustaining the innovation economy.

In order to assess Maine's performance on the indicators relative to other states and regions, the data for Maine is compared with data for relevant comparison, or reference groups. The reference groups are the U.S. as a whole, the New England states, and the states that are included in the Experimental Program to Stimulate Competitive Research (EPSCoR).³ The comparison with the U.S. provides the benchmark most commonly used by similar studies that measure a state's performance. The comparison with the New England states allows for an assessment of how well Maine is doing relative to the state's geographic neighbors with whom Maine competes for innovation resources and industry. The comparison with EPSCoR states

provides the most analytically sound benchmark because it compares Maine to states that are similar in terms of their historical performance on R&D indicators. Most of the EPSCoR states are rural and lack a high concentration of industry and related innovation resources.

Table 1 presents a summary of Maine's performance for the 25 primary innovation indicators. It is important to note that for some of the indicators, data for the reference group comparisons and five-year trends is not available. The indicators presented are not meant to be the sole-source, definitive assessment of whether Maine is succeeding in building and sustaining an innovation economy. Like all states, Maine has areas that represent strengths or assets that will serve as the building blocks for the future economy. It also has areas requiring improvement in order for the state to foster innovation, leading to commercialization and economic growth. In many of these areas Maine has made significant progress in the last five years. However, it is clear from several of the indicators that more needs to be done.

Existing areas of strength for Maine in building and sustaining an innovation driven economy – The following are indicators for which Maine's performance ranks it within the top 20 states in the latest year for which data is available:

- Not-for-Profit Laboratory R&D Performance
- SBIR/STTR Funding
- Entrepreneurial Activity (new indicator for 2008)
- Math Skills of 8th Grade Students
- Science Skills of 8th Grade Students
- Household Connectivity
- Classroom Connectivity

Areas in which Maine showed improvement during the last five years in building and sustaining an innovation driven economy - The following are indicators for which Maine experienced a trend of improvement during the last five years:

- Industry R&D Performance
- Academic R&D Performance
- Not-for-Profit Laboratory R&D Performance
- State R&D Funding
- SBIR/STTR Funding
- Per Capita Income
- Math Skills of 8th Grade Students
- Science and Engineering Graduate Enrollments
- Science and Engineering Degrees Awarded
- Education Attainment - % of Population 25 and Older with Bachelor's Degree or More
- Household Connectivity
- High Speed Internet Access
- Classroom Connectivity

Areas in which Maine outperforms its EPSCoR peers - Success in economic development does not occur overnight, and Maine, building from a position well behind other states, still has a way to go to successfully compete with the top tier states. However, in several indicators, Maine outperforms its peer states as defined by the EPSCoR program. The following are indicators for which Maine's performance exceeds the EPSCoR states as a whole in the latest year for which data is available:

- Industry R&D Performance
- Not-for-Profit Laboratory R&D Performance
- SBIR/STTR Funding
- Entrepreneurial Activity
- Ph.D. Scientists and Engineers in the Labor Force
- Math Skills of 8th Grade Students
- Science Skills of 8th Grade Students
- Education Attainment - % of Population 25 and Older with Bachelor's Degree or More
- Household Connectivity
- High Speed Internet Access
- Classroom Connectivity

Existing areas requiring improvement for Maine in building and sustaining an innovation driven economy - The following are indicators for which Maine's performance ranks it within the bottom 20 states in the latest year for which data is available:

- Total R&D Performance
- Industry R&D Performance
- Academic R&D Performance
- Federal R&D Obligations
- Venture Capital Investments
- Patents Issued
- High Technology Business Establishments - % Change
- S&E Occupations in the Workforce
- Gross State Product- % Change
- Per Capita Income
- Science and Engineering Graduate Enrollments
- High Speed Internet Access

 ↔ = No Change or Equal
 N/A = Not Applicable or Data Not Available

Endnotes

1 *Innovate America*, Council of Competitiveness, 2004

2 see endnote 1

3 EPSCoR focuses on those states that have historically received lesser amounts of federal R&D funding and have demonstrated a commitment to develop their research bases and to improve the quality of science and engineering research conducted at their universities and colleges. The program currently operates in 23 states: Alabama, Alaska, Arkansas, Delaware, Hawaii, Idaho, Kansas, Kentucky, Louisiana, Maine, Mississippi, Montana, Nebraska, Nevada, New Mexico, North Dakota, Oklahoma, South Carolina, South Dakota, Tennessee, Vermont, West Virginia, and Wyoming, as well as the Commonwealth of Puerto Rico and the U.S. Virgin Islands. This description is from the EPSCoR Web site at: <http://www.ehr.nsf.gov/epscor/start.cfm>.

indicators:

- Total R&D Performance
- Industry R&D Performance
- Academic R&D Performance
- Not-for-Profit Laboratory R&D Performance
- Federal R&D Obligations
- State R&D Investments

RESEARCH & DEVELOPMENT CAPACITY OVERVIEW

Research and development (R&D) is a driving force in economic growth. It fuels innovation that leads to new products and services, new industries, new jobs and ultimately an improved quality of life. R&D activity also attracts and supports a highly educated and skilled workforce.

In the last ten years, Maine has made progress on building R&D capacity and performance. In 1997 Maine ranked 49th among all states in total R&D as a percent of gross state product (GSP). In 2004, the latest year for which comparable data is available, Maine improved its ranking to 41st. In terms of R&D performance by sector, Maine ranks high in not-for-profit R&D nationally (ranking 3rd highest nationally in terms of R&D performed as a percent of GSP), and lower in terms of industry and academic R&D; however recently the state is making considerable progress on these latter two indicators. In 2001 Maine ranked 35th in industry R&D as a percent of GSP. In 2005 it improved to 32nd. In 2002 Maine ranked 49th in industry R&D as a percent of GSP but improved to 43rd in 2006.

Maine's improvement in R&D capacity is by design. In the early 1990's Maine invested very little in R&D with annual funding levels below \$3 million. Since 2000, Maine has maintained annual R&D investment levels in excess of \$20 millions with peaks occurring in 2003-04 and 2007-08 which included the passage of major bonds for R&D.

Most of the R&D performance indicators in this section are expressed as a percentage of GSP. This provides a measure of both the intensity of R&D in the state (How much is occurring?) and the importance of R&D to the economy (What is its impact?). GSP is also the most accurate way of comparing R&D investments in Maine to other states and the nation. In order to assess Maine's performance relative to other geographic areas, the R&D indicators in this section are presented in comparison to three reference groups. They are the U.S. as a whole, New England, and states that are part of The Experimental Program to Stimulate Competitive Research (EPSCoR).

These indicators attempt to present the most complete picture of R&D funding in Maine, but they are limited by the availability of data. For example, nationwide data on state investments in R&D are not available; likewise, figures for R&D spending by not-for-profit laboratories reflect only their federal sources of funding.

Total R&D Performance

— performance summary —

Maine 1-Year Trend	↓
Maine 5-Year Trend	↑
Maine Compared to EPSCoR	↓
Maine's National Ranking	41

Summary

In 2004, total R&D performance in Maine represented 0.89 percent of GSP compared to 2.43 percent for the U.S., 4.33 percent for New England, and 1.39 percent for the EPSCoR states. While Maine lags that of the reference groups on this indicator, the state has been making progress. **In 1997 Maine ranked 49th among all states in total R&D as a percent of gross state product (GSP). In 2004, the latest year for which comparable data is available, Maine improved its ranking to 41st.**

Total R&D Spending as a Percent of Gross State Product – 1995-2004

Why This Is Significant

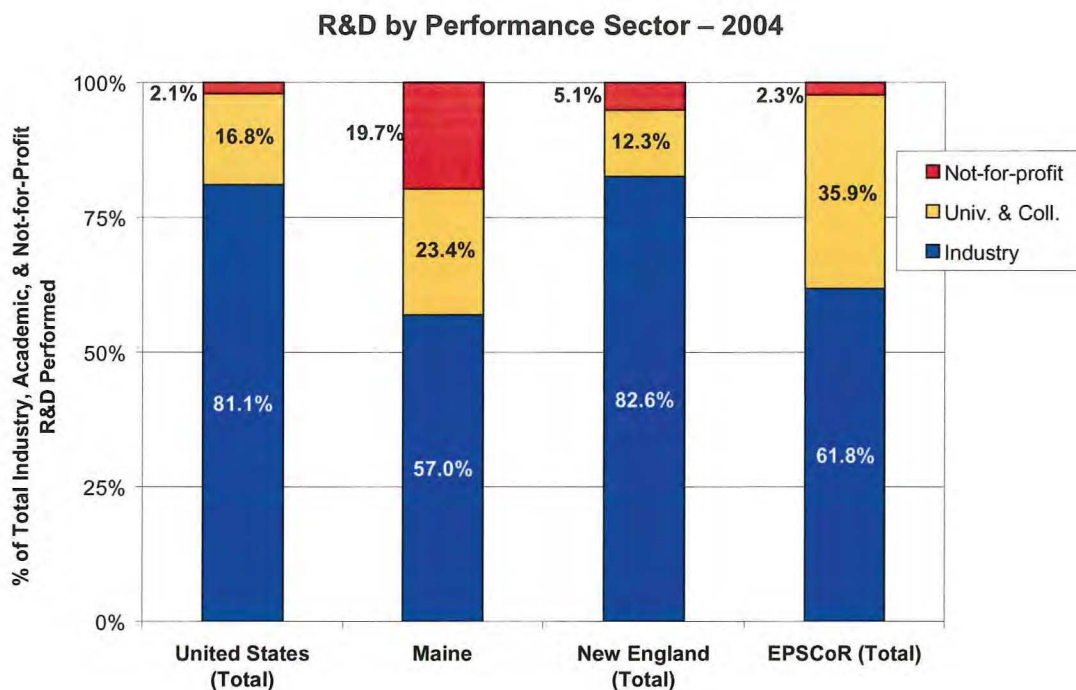

An innovation economy requires investments in research and development by government, industry, not-for-profit laboratories, and academia. This indicator is the most comprehensive measure of R&D capacity in Maine and captures all available sources of comparable state data. Expressing R&D expenditures as a percent of gross state product measures both the impact of R&D on the economy and the intensity of R&D that is occurring.

TOTAL R&D PERFORMANCE**Related**

In 2004, total R&D performed reached \$384.4 million in Maine. This represented a decrease of 11.6 percent from the 2002 level of \$429 million¹. Between 2000 and 2004 total R&D performed in Maine increased 20.6 percent compared to 35.1 percent for New England and 43.4 percent among the EPSCoR states. However Maine did increase more than the U.S. as a whole that saw an increase of 7.1 percent. Between 2003 and 2004, the latest two years for which comparable state data is available, Maine (at 3.3 percent) experienced a higher growth rate in total R&D than both the U.S. (2.1 percent) as a whole and the EPSCoR states (-2.1 percent), but grew less than New England (6.9 percent).

Total R&D Spending in Maine – 1995-2004

In terms of the sectors contributing to R&D performance, Maine has a higher percentage of R&D being performed by the not for profit sector than any of the reference groups. Out of R&D performed by the three major sectors (industry, academic, and not for profit) in 2004, 19.7 percent of R&D performed was by the not for profit sector in Maine. This compares to 2.1 percent in the U.S. as a whole, 5.1 percent among New England states, and 2.3 percent among EP-SCoR states. In contrast however, in 2004, Maine had a lower percentage of industry R&D being performed among the three major performance sectors with a level of 57.0 percent compared to 81.1 percent for the U.S., 82.6 percent for New England states, and 61.8 percent for the EPSCoR states as a whole.

Sources

Total R&D spending² is from National Science Foundation/Division of Science Resources Statistics; National Patterns of R&D Resources 2002 & 2004 Data Updates, derived from four NSF surveys: Survey of Industrial R&D; Survey of R&D Expenditures at Universities and Colleges, Survey of Federal Funds for R&D, and Survey of R&D Funding and Performance by Nonprofit Organizations; <http://www.nsf.gov/statistics>. Gross State Product is from Bureau of Economic Analysis, U.S. Department of Commerce, 1980-1996 data; and Revised Estimates for 1997-2006; <http://www.bea.gov/regional/gsp/>. 1997-2006 is based on NAICS while 1980-1996 is based on SIC industry classification.

Industry R&D Performance

— performance summary —

Maine 1-Year Trend	↑
Maine 5-Year Trend	↑
Maine Compared to EPSCoR	↑
Maine's National Ranking	32

Summary

After several years of declining capacity industry R&D performed in Maine grew to \$350 million in 2005, an increase of 64 percent from the 2004 level of \$213 million. In 2005, industry R&D in Maine represented 0.78 percent of gross state product (GSP). This was higher than the EPSCoR level of 0.60 but lower than the U.S. at 1.83 and New England at 3.65. Maine's recent increase on this indicator moved it from ranking 40th in the nation in 2004 to 32nd in 2005.

Why This Is Significant

This indicator measures Maine's private sector investments in innovation. Since industry R&D comprises the vast majority of the nation's total R&D investments, R&D by this sector is integral to growing the state's R&D capacity. Industry R&D drives state economic growth by creating high paying jobs for the performance of R&D, increasing productivity, and generating commercialization of new products and services. Industry R&D is particularly important for transforming and growing Maine's economy which has been historically reliant on traditional, natural resource-based industries. R&D can both strengthen these industries as well as create opportunities for new industries in the state.

INDUSTRY R&D PERFORMANCE

Related

In 2005, industry R&D in Maine equaled \$350 million. This was higher than any level performed since 1987 and represented a 41 percent increase since 2001.

Sources

Industry R&D performance is from National Science Foundation/Division of Science Resources Statistics, Survey of Industrial Research and Development: 2005 forthcoming; <http://www.nsf.gov/statistics>. Gross State Product is from Bureau of Economic Analysis, U.S. Department of Commerce, 1980-1996 data; and Revised Estimates for 1997-2006; <http://www.bea.gov/regional/gsp/>. 1997-2006 is based on NAICS while 1980-1996 is based on SIC industry classification.

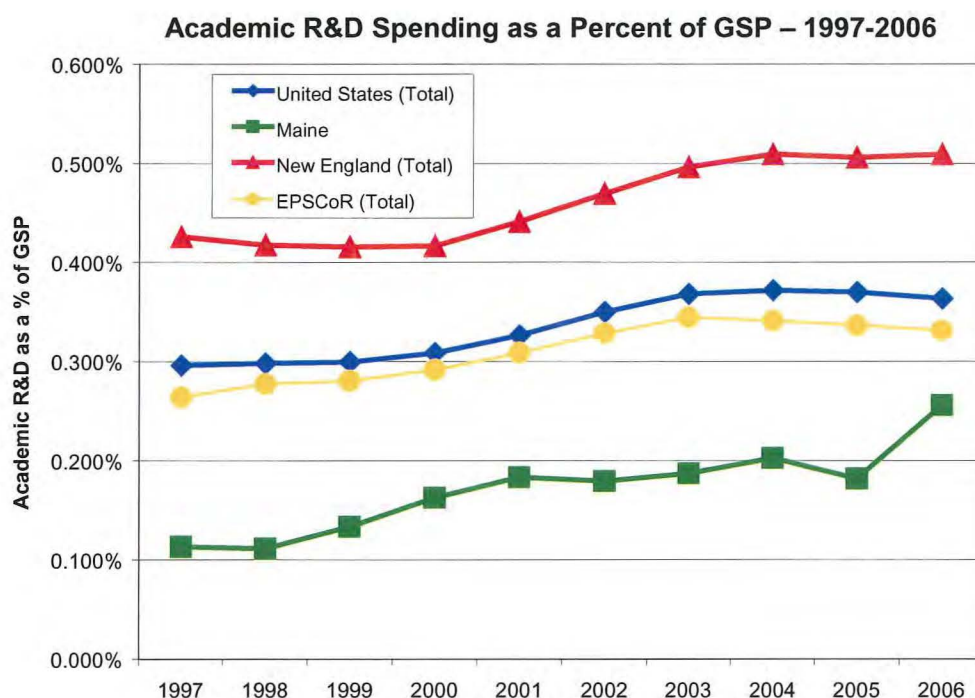

Academic R&D Performance

— performance summary —

Maine 1-Year Trend	↑
Maine 5-Year Trend	↑
Maine Compared to EPSCoR	↓
Maine's National Ranking	43

Summary

In 2006, R&D performed at academic institutions in Maine equaled \$120 million, which was a 47 percent increase from the 2005 level. While Maine still lags the benchmark groups including the EPSCoR states, the state has made ground on this indicator. In 2006 R&D performed at Maine academic institutions represented 0.26 percent of GSP compared to 0.36 percent in the U.S. as a whole, 0.51 percent among New England states, and 0.33 percent for all EPSCoR states combined. Between 2002 and 2006 growth in academic R&D in Maine equaled 73 percent outpacing the growth experienced on average in the U.S and New England (31 percent), and the EPSCoR states (33 percent).

Why This Is Significant

Universities and colleges are a major source of knowledge and research. In this knowledge-based economy, businesses increasingly seek to develop partnerships with research-oriented universities and colleges to develop and test innovative products and services. A healthy economy also benefits from knowledge workers that begin their advanced learning and research experiences at universities and colleges. This requires investments in R&D at universities and colleges. This indicator reflects the capacity of Maine universities and colleges to conduct R&D and contribute to knowledge-based economic development.

ACADEMIC R&D PERFORMANCE

Related

In 2006 38.2 percent of all R&D performed by academic institutions in Maine was within the life sciences field.³ This was the largest field of study for academic-performed R&D in Maine. Environmental sciences followed at 19.2 percent and then social sciences at 17.8 percent. These three areas accounted for 75 percent of academic-performed R&D in Maine in 2006. Life sciences include the fields of agricultural, biological, and medical sciences; and environmental sciences include the fields of atmospheric sciences, earth sciences, and oceanography. Percentages for other fields of study for academic-performed R&D in Maine in 2006 included engineering at 12.5 percent, physical sciences at 4.8 percent, and math and computer sciences at 2.1 percent.

In comparison to the reference group, in 2006 Maine had a greater concentration of academic performed R&D in the fields of environmental and social sciences and a lower concentration in the field of life sciences.

ACADEMIC R&D PERFORMANCE

Sources

Academic R&D performance data⁴ is from National Science Foundation/Division of Science Resources Statistics; Survey of R&D Expenditures at Universities and Colleges 2006; <http://www.nsf.gov/statistics>. Gross State Product is from Bureau of Economic Analysis, U.S. Department of Commerce, 1980-1996 data; and Revised Estimates for 1997-2006; <http://www.bea.gov/regional/gsp/>. 1997-2006 is based on NAICS while 1980-1996 is based on SIC industry classification

Not-for-Profit Laboratory R&D Performance⁵

— performance summary —

Maine 1-Year Trend	↓
Maine 5-Year Trend	↑
Maine Compared to EPSCoR	↑
Maine's National Ranking	3

Summary

Maine continues to be a national leader in R&D performed by not-for-profit research laboratories. Since 1995, R&D performed at Maine's not-for-profit research labs from federal sources of funding grew dramatically, from 0.084 percent in 1995 reaching 0.234 percent of GSP in 2002. In 2003 Maine's level dropped to 0.181 percent and then again fell to 0.170 percent in 2004 but remained significantly above the level of the nation as a whole at 0.046 percent and the EPSCoR states combined at 0.022 percent of GSP. The New England level in 2004 was 0.211 percent, or above the Maine level.

**Federal Support for Not-for-Profit R&D Spending per Worker
1995-2004**

Why This Is Significant

Maine has a robust and economically important not-for-profit research sector. In Maine this sector includes the institutions of Bigelow Laboratory for Ocean Sciences, Foundation for Blood Research, Gulf of Maine Research Aquarium, Jackson Laboratory, Maine Medical Center Research Institute, Mount Desert Island Biological Laboratory, Maine Institute for Human Genetics and Health, and the Wells National Estuarine Research Reserve. This is significant because Maine has historically lacked private academic institutions, such as a medical school, that focus on R&D. The not-for-profit institutions are involved in various partnerships with the University of Maine which helps increase Maine's overall R&D capacity. Taken together, Maine's not for profit research labs and academic institutions contribute significantly to both R&D performance and the development of students and talent.

NOT-FOR-PROFIT LABORATORY R&D PERFORMANCE**Related**

In terms of absolute dollars, federal funding for not-for-profit R&D performance in Maine has increased from \$23 million in 1995 to more than \$73 million in 2004, an increase of over 215 percent.

**Sources**

1987-2001 not-for-profit R&D performed is from National Science Foundation/Division of Science Resources Statistics; National Patterns of R&D Resources 2002 Data Update, derived from Survey of R&D Funding and Performance by Nonprofit Organizations; 2002-2004 is from National Science Foundation/Division of Science Resources Statistics, Survey of Federal Funds for Research and Development: Fiscal Years 2002, 2003, 2004, and 2005; <http://www.nsf.gov/statistics>. Gross State Product is from Bureau of Economic Analysis, U.S. Department of Commerce, 1980-1996 data; and Revised Estimates for 1997-2006; <http://www.bea.gov/regional/gsp/>. 1997-2006 is based on NAICS while 1980-1996 is based on SIC industry classification.

Federal R&D Obligations

— performance summary —

Maine 1-Year Trend	↑
Maine 5-Year Trend	↓
Maine Compared to EPSCoR	↓
Maine's National Ranking	33

Summary

Between 1995 and 2001, Maine experienced significant increases in federal funding for R&D to a point where the state caught up with the reference groups on this indicator.⁶ During this period federal funding for R&D in Maine increased from 0.19 percent of gross state product (GSP) to 1.21 percent. However from 2001 to 2003, Maine experienced a drop on this indicator to a level of 0.36 percent of GSP. Maine has seen some recovery in 2004 with a level of 0.44 percent of GSP, but it still falls below the average of the U.S. as a whole (0.85 percent), the New England level (1.32 percent), and the EPSCoR level (0.78 percent).

Total Federal R&D Obligations as a Percent of GSP – 1995-2004

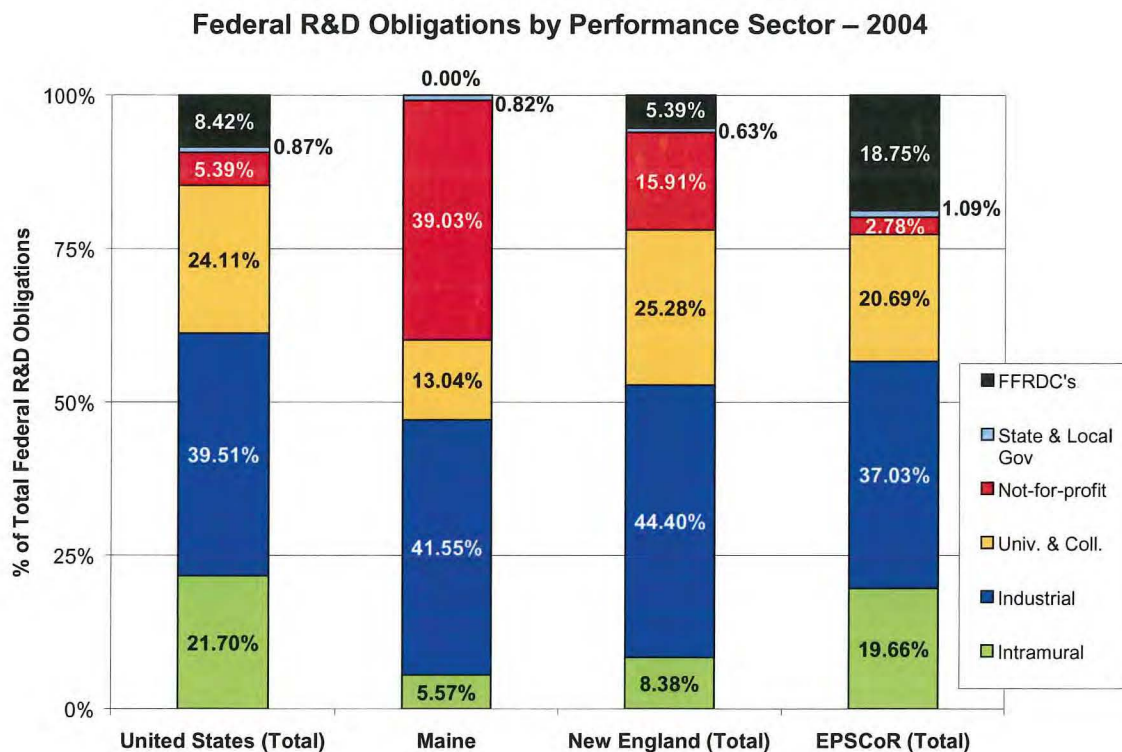

Why This Is Significant

Federal funding is an important source of financial support for R&D, contributing approximately 30 percent of total R&D funding in the U.S. This indicator measures Maine's capacity to access federal funds to support its R&D enterprise. State investments in R&D infrastructure build on the capacity of research entities to access federal R&D grants.

FEDERAL R&D OBLIGATIONS

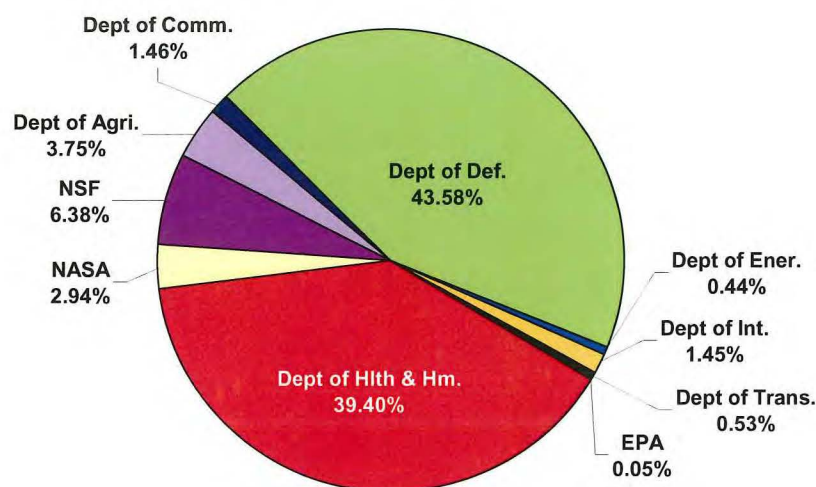

Related

In 2004, the industrial research sector was the largest recipient of federally funded R&D in Maine, accounting for 41.5 percent of the state's federal R&D obligations. Following this was the not-for-profit research sector at 39 percent.⁷ In comparison to the reference groups – the U.S. as a whole, New England, and the EPSCoR states – Maine's federal obligations for R&D were more highly concentrated in the not-for-profit performance sector and less concentrated in the academic sector.

In terms of which federal agencies the funding comes from, in 2004, 44 percent of Maine's federal obligations for R&D came from the Department of Defense followed by 39 percent from the Department of Health and Human Services. All other federal agencies accounted for a total of 18 percent. In comparison to the U.S. as a whole in 2004, Maine is more dependent on the Department of Health and Human Services for federal R&D obligations.

Federal R&D Obligations by Funding Agency – Maine - 2004

Federal R&D Obligations by Funding Agency – U.S. - 2004

Sources

Federal R&D obligations⁸ are from National Science Foundation/Division of Science Resources Statistics; Survey of Federal Funds for Research and Development: Fiscal Years 2003, 2004, and 2005; <http://www.nsf.gov/statistics>. Gross State Product is from Bureau of Economic Analysis, U.S. Department of Commerce, 1980-1996 data; and Revised Estimates for 1997-2006; <http://www.bea.gov/regional/gsp/>. 1997-2006 is based on NAICS while 1980-1996 is based on SIC industry classification.

State R&D Investments

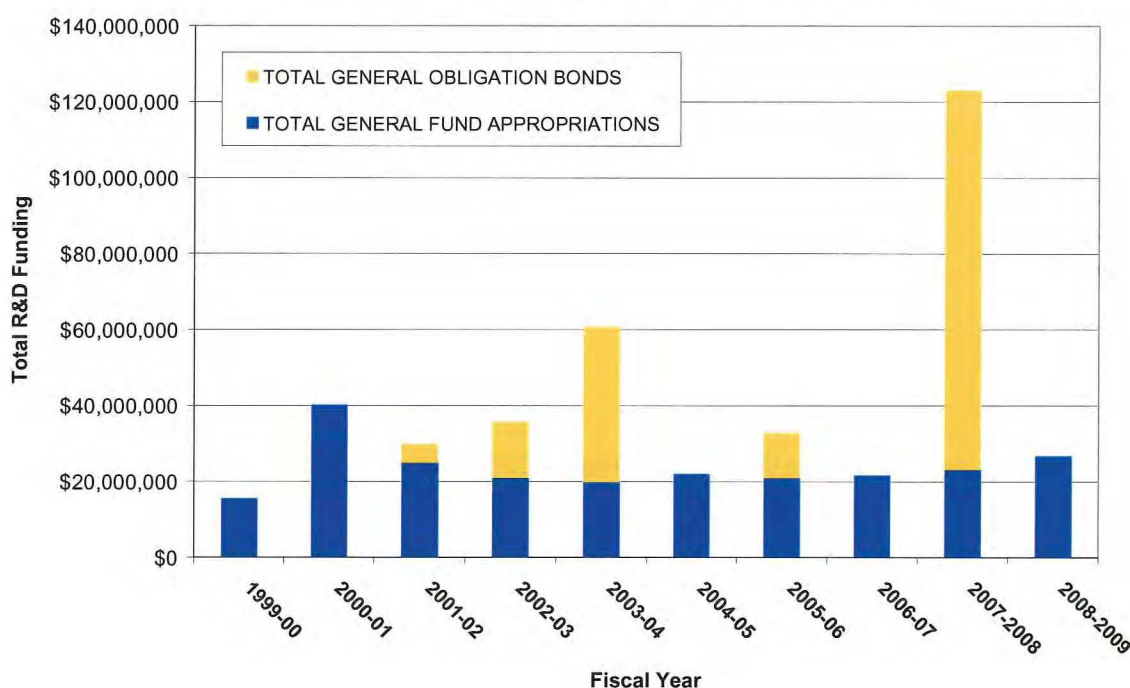

— performance summary —

Maine 1-Year Trend	↑
Maine 5-Year Trend	↑

Summary

Over the last ten years Maine has seen an increase in state-sponsored investments in research and development. In FY 1999-00, Maine had an annual investment level in R&D of \$15.4 million. By 2003-04, Maine's annual investment exceeded \$60.7 million. Since 2003-04 Maine has maintained an annual state investment level of general fund appropriations in excess of \$20 million annually with a general obligation bond raising the funding level in 2007-2008 to over \$73 million.

State of Maine R&D Funding – FY1999/00-2008/09

Why This Is Significant

Maine's state-sponsored investments in research and development are used to build infrastructure and leverage federal and industry research funding. Federal R&D expenditures rarely fund research equipment and facilities. Thus, state investments are essential to build physical R&D capacity and to stimulate successful private/public research partnerships. Maine state funds, in particular those provided through the Maine Technology Institute, are also used to fund R&D in small and medium sized business. These businesses don't always have access in the near term to federal R&D funding.

STATE R&D INVESTMENTS

Related

From fiscal year 1996/97 to fiscal year 2008/09, Maine has invested a total of almost \$400 million in state funds for R&D. Of this amount, 45.9 percent has supported programs and infrastructure of the University of Maine System, 27.0 percent has supported numerous businesses through the Maine Technology Institute; and 13.2 percent has supported the Maine Biomedical Research Fund.

Maine State Funding for R&D by Program FY1996/97-FY2008/09

Total State Funding for R&D = \$397,126,970

Source

State R&D investment was compiled by PolicyOne Research, Inc. from data provided by the Maine Legislature, Office of Fiscal & Program Review.

Endnotes

- 1 2002 was characterized by a spike in federally funded R&D performed by Maine's not-for-profit research labs which in that year performed in excess of \$90 million in federally funded R&D, the highest level reached between 1995 and 2004.
- 2 Total R&D includes R&D for all performance sectors including industry, universities and colleges, non-profit institutions, federal government, and federally funded research development centers from all sources of funding. Not-for-profit performed R&D as reported by NSF includes only that which is funded by the federal government. Therefore, this data understates the intensity of not-for-profit performed R&D.
- 3 Academic Fields of Study are defined as: Engineering (aeronautical and astronautical, bioengineering and biomedical, chemical, civil, electrical, mechanical, metallurgical and materials); Physical Sciences (astronomy, chemistry, physics); Environmental Sciences (atmospheric, earth sciences, oceanography); Mathematical Sciences; Computer Sciences; Life Sciences (agricultural, biological, medical); Psychology; Social Sciences (economics, political science, sociology); unclassified.
- 4 Academic R&D performance excludes federally funded research and development centers administered by academic institutions, of which Maine has none.
- 5 Excludes not-for-profit federally funded research and development centers administered by academic institutions for which there are none in Maine but that do exist nationally. Also, the not-for-profit data only includes research expenditures funded by the federal government because data from other funding sources is not available on a state basis.
- 6 The federal R&D data in this section represent obligations as opposed to outlays. According to NSF, obligations represent the amounts for orders placed, contracts awarded, services received, and similar transactions during a given period, regardless of when the funds were appropriated and when future payment of money is required.
- 7 This includes federally funded research and development centers (FFRDC's). These are R&D-performing organizations that are exclusively or substantially financed by the Federal Government and are supported by the Federal Government either to meet a particular R&D objective or, in some instances, to provide major facilities at universities for research and associated training purposes. Each center is administered either by an industrial firm, a university, or another nonprofit institution. Maine has no FFRDC's. Intramural performers are the agencies of the Federal Government. Their work is carried on directly by federal agency personnel.
- 8 Includes the obligations of the 10 or 11 major R&D supporting agencies that were requested to report this information; together they represent 96 percent or more of the total R&D obligations.
- 9 Includes appropriations as well as bonds approved.
- 10 Includes Maine Economic Improvement Fund, State Res. Lib. for Business, Science & Technology, Strategic Technology Initiative Program Funding, Debt Service for previous R&D Bonds, and Bonds for the Advanced Engineered Wood Composites Center, USM Bioscience Wing, and Maine Agricultural Research Farms. Includes all campuses within UMaine System.
- 11 State R&D investments in Maine include portions of funding within the following program areas:
 - University of Maine System
 - Maine Technology Institute
 - Maine Marine Research Fund
 - Maine Biomedical Research Fund
 - Maine Applied Technology Development Center System

Centers for Innovation
MERITS
ScienceWorks
Governor's Marine Studies Fellowship
Small Enterprise Growth Fund

indicators:

- SBIR/STTR Funding
- Venture Capital Investments
- Patents Issued
- Entrepreneurial Activity

INNOVATION CAPACITY OVERVIEW

Financial investment, knowledge, skill, and creativity form a package of ingredients that foster an innovative business environment. This environment allows people to take risks, create new products and services, and grow their business ventures.

Maine is a leader in the area of SBIR/STTR research relative to the state's size. Maine's and New England's levels of SBIR/STTR funding as a percent of GSP exceeded the levels of the U.S. average and all EPSCoR states combined.

Maine needs to continue its work in the areas of attracting venture capital and producing patents. In the latest years for which data is available Maine lags New England, the U.S., and EPSCoR states as a whole in generating patents. Maine and the EPSCoR states continue to lag the nation and New England in attracting venture capital. The findings in this index are consistent with the findings in Maine's Comprehensive Evaluation of State Investments in R&D that Maine need to continue to improve its ability to transfer knowledge and technology to commercial applications and ventures. Recent state investments in programs including the Maine Patent Program and the Small Enterprise Growth Fund combined with continued R&D support for entrepreneurs through the Maine Technology Institute and the Applied Technology Development Centers can help Maine address these areas of concern. Maine also ranks well in terms of entrepreneurial activity as measured by persons starting businesses. This suggests that as Maine continues to develop its capacity in other areas (education, R&D, and connectivity) its entrepreneurial spirit will help convert capacity building into economic output.

SBIR/STTR Funding

Summary

— performance summary —

Maine 1-Year Trend	↑
Maine 5-Year Trend	↑
Maine Compared to EPSCoR	↑
Maine's National Ranking	15

Between 1997 and 2004 Maine experienced an increase in SBIR/STTR funding as a percent of gross state product (GSP). In 1997, SBIR/STTR funding in Maine represented 0.0051 percent of GSP; in 2004 it represented 0.0223 percent. This recent increase elevated Maine above the levels for the U.S. as a whole which was 0.0191 percent and the level for the EPSCoR states combined at 0.0127 percent. Maine remained below the level for the New England States as a whole in 2004 which were at 0.0612 percent.

**Total SBIR & STTR \$ as a Percent of Gross State Product
1997-2004**

Why This Is Significant

The Small Business Innovation Research (SBIR) and Small Business Technology Transfer (STTR) programs are important sources of early stage capital for technology-based entrepreneurs. The U.S. Congress established the SBIR program with the purpose of increasing opportunities for small businesses to participate in federal research and development and to stimulate technological innovation. The program funds high-risk R&D that may have commercial potential. It offers a way for small firms to obtain seed money to do the advanced R&D often necessary to enter into new projects. Similarly, Congress created the STTR program to encourage commercialization of university and federal laboratory R&D by small businesses and to foster the development of partnerships between universities and small firms.

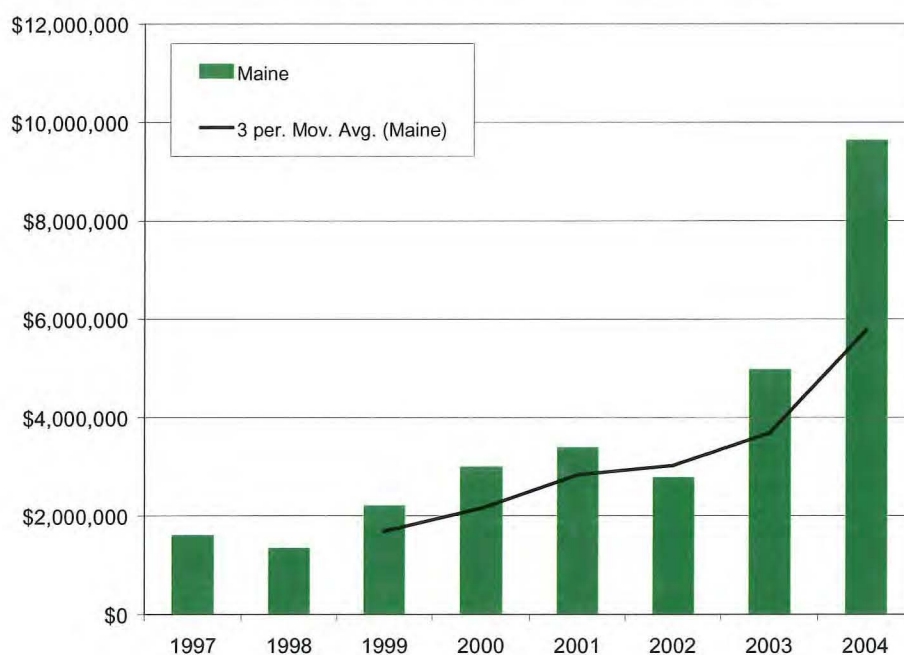

These programs are valuable in that they help small businesses build scientific and technical leadership in their industries. In an increasingly competitive marketplace, such leadership is key to innovation and the subsequent sales

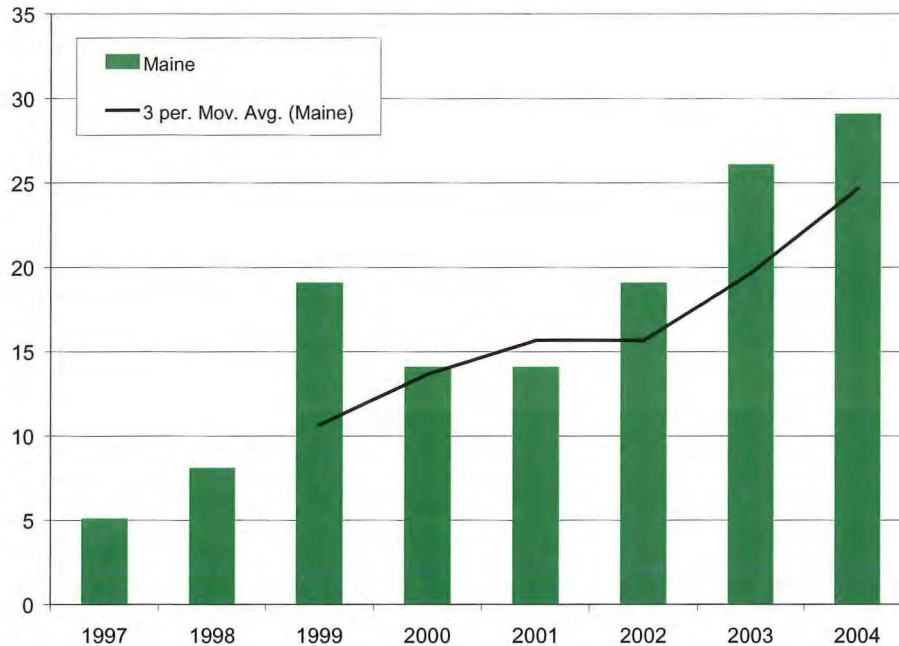

SBIR/STTR FUNDING

that innovation brings to small firms. Success in winning SBIR awards also is often helpful in attracting outside capital investments.

Related

In 2004 the SBIR/STTR programs provided more than \$2 billion nationwide in federally sponsored, early stage capital for entrepreneurial technology-based businesses. In 2004, Maine companies received a total of \$9.6 million in SBIR/STTR awards. This represented an increase of 224 percent since 2000. In terms of number of awards, in 2004, Maine received 29 awards, the highest award level since 1997.

Venture Capital Investments

— Performance Summary —

Maine 1-Year Trend	↑
Maine 5-Year Trend	↓
Maine Compared to EPSCoR	↔
Maine's National Ranking	34

Summary

In 2006, venture capital investments in Maine were 0.016 percent of gross state product (GSP). This was significantly lower than the New England level of 0.475 percent and the total U.S. level of 0.201 percent for the same year, but on par with the level for all EPSCoR states combined at 0.015. Historically, Maine's venture capital investments as a percentage of GSP remained relatively low between 1995 and 1997. This was followed by a period of increases to a peak level of 0.394 percent in 2000 before falling to low levels again through 2005.

Venture Capital Invested as a Percent of Gross State Product – 1997-2006

Why This Is Significant

Venture capital is a critical source of funding for technology-based startups and companies with high growth potential. Access to capital is one of the most important success factors for technology companies. States with access to venture capital are more likely to foster the creation of technology-based companies. According to the U.S. Federal Reserve, less than two percent of small business financing comes from venture capital. However, venture capital is significant for companies with the highest growth potential. This includes technology-based companies. Non-dense regions and states such as Maine typically have less access to venture capital making it important for the State to develop ways of attracting interest from venture capitalists in nearby centers such as Boston.

VENTURE CAPITAL INVESTMENTS

Related

In 2006, Maine received \$7.6 million in venture capital investments. This represented an increase of 69 percent from Maine 2005 level of \$4.5 million. Maine's \$7.6 million in venture capital received in 2006 was part of four separate deals within the industry classes of biotechnology, software, and financial services.

Patents Issued

— Performance Summary —

Maine 1-Year Trend	↔
Maine 5-Year Trend	↓
Maine Compared to EPSCoR	↓
Maine's National Ranking	41

Summary

The number of patents issued per 1,000 residents of Maine lagged behind the reference groups.¹ In 2006 there were 0.12 patents issued per 1,000 Maine residents in comparison to 0.34 for the U.S. as a whole, 0.55 in New England, and 0.16 among the EPSCoR states. This trend has remained relatively consistent from 1997 through 2004, however in 2005 Maine increased on this indicator relative to the reference groups. In 2006 Maine had a slight decrease (0.002) while the reference groups all increased.

Why This Is Significant

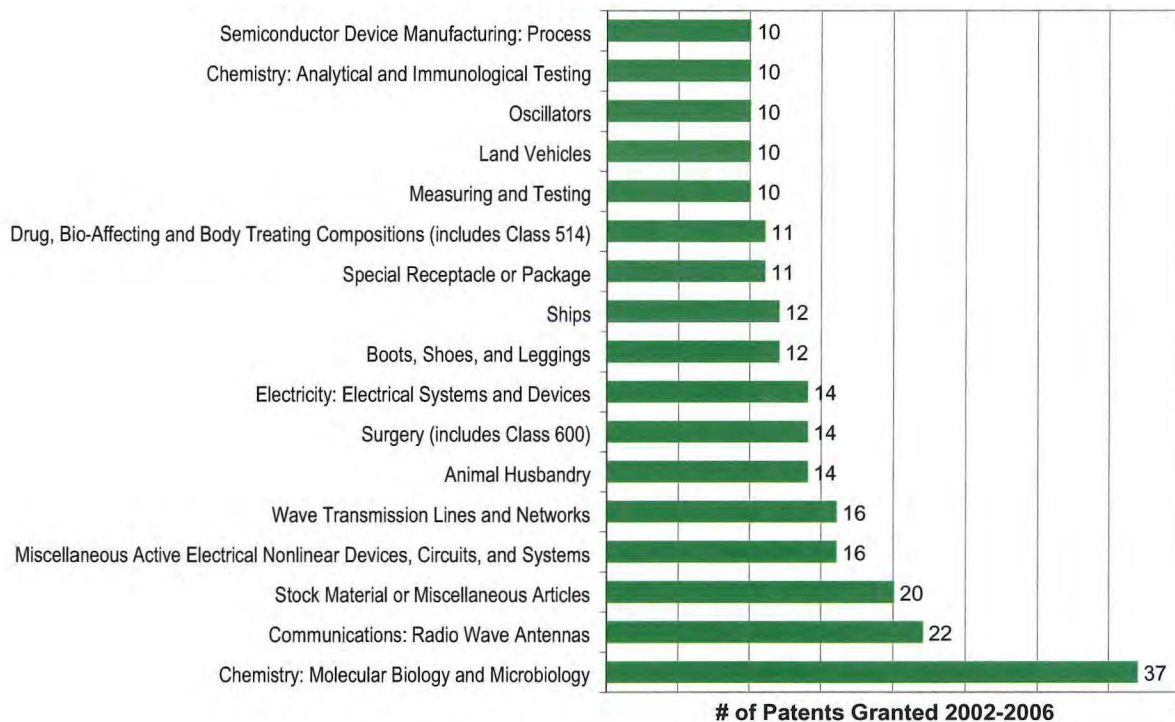

Patent activity indicates the level of innovative thinking and research that eventually may lead to commercialization of new products and services. Individuals and companies seek patent protection in anticipation of the commercial value and marketability of their new ideas. In 2000, Maine created the Maine Patent Program to provide patent assistance to businesses and individuals. This program has served over 500 business and individuals since its inception.

PATENTS ISSUED

Related

Between 2002 and 2006, there were a total of 730 utility patents² - that is, patents for inventions issued to Maine residents. The largest percent of these fell within the classification entitled “chemistry: molecular biology and microbiology,” which accounted for four percent. Other significant utility classes in Maine since 2002 included communications: radio wave antennas; and stock material or miscellaneous articles.

Entrepreneurial Activity

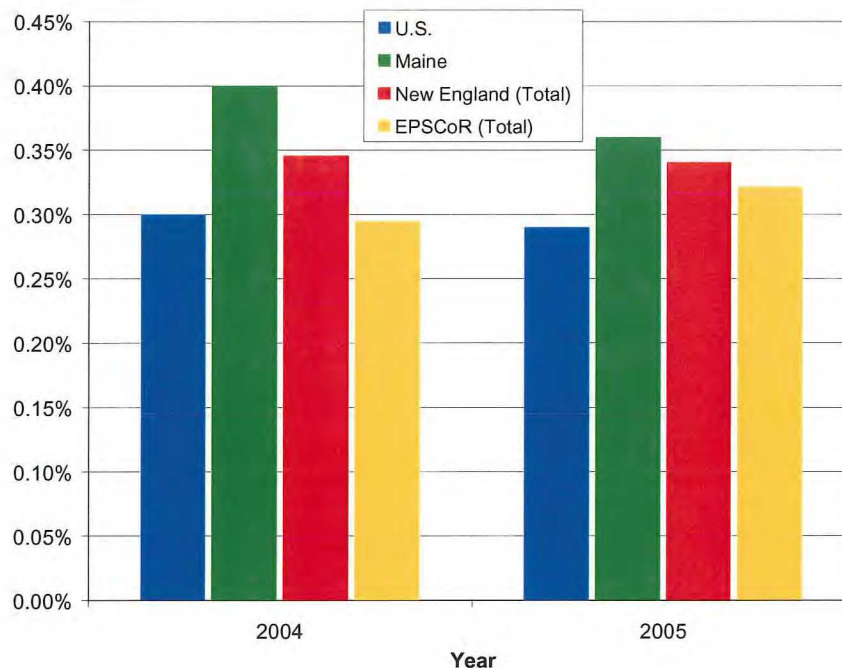

— Performance Summary —

Maine 1-Year Trend	↓
Maine 5-Year Trend	N/A
Maine Compared to EPSCoR	↑
Maine's National Ranking	13

Summary

Based on the Kaufman Index of Entrepreneurial Activity³ in 2006 Maine has a higher level of entrepreneurial activity than the reference groups. This indicator measures the percent of persons starting a business. In 2006, Maine's entrepreneurial index was 0.36 percent which was higher than that for the U.S. as a whole (0.29 percent), New England (0.34 percent), and the EPSCoR states (0.32 percent). Maine, as a state, ranked thirteenth in the nation on this indicator.

Index of Entrepreneurial Activity 2004 - 2005

Why This Is Significant

Entrepreneurial activity measures the willingness of persons to take risks and grow a business. A strong regional economy provides an environment that encourages this risk taking and supports the efforts to start and grow businesses. Maine has put in place a host of programs to encourage and support entrepreneurs in science and technology in the areas of financing, technical services, networking, marketing, and business development.

Sources

Estimates calculated by Robert W. Fairlie, University of California, Santa Cruz, using the Current Population Survey and reported in "Kauffman Index of Entrepreneurial Activity"; Ewing Marion Kauffman Foundation www.kauffman.org

Endnotes

- 1 The residence of the first-named inventor determines the origin of a patent.
- 2 The utility patent data excludes design patents, plant patents, reissues, defensive publications, and statutory inventions registrations.
- 3 Entrepreneurial activity is the percent of individuals (ages 20–64) who do not own a business in the first survey month that start a business in the following month with fifteen or more hours worked per week.

indicators:

- High Technology Employment Growth
- High Technology Business Establishment Growth
- S&E Occupations in the Workforce
- Ph.D. Scientists and Engineers in the Labor Force
- Gross State Product Growth
- Per Capita Income

EMPLOYMENT & OUTPUT CAPACITY OVERVIEW

While technology industries span a wide range of economic activity and exhibit different patterns of growth and contraction, technology is playing an increasing role in all industries and hence businesses and occupations. Technology intensive economic activity tends to occur most where there are clusters of professionals, companies, and institutions developing a deep pool of skilled workers and networks of investors and entrepreneurs.

Employment and business growth are primary economic outcome measures. In Maine, between 2004 and 2005 high technology employment grew 3.1 percent in Maine, a rate that was higher than that experienced in the U.S. and New England but lower than that for the EPSCoR states on average. During the same period high technology business establishment growth in Maine equaled that of New England but trailed that of the U.S. and EPSCoR states. It is encouraging that during this period Maine's technology related employment and business establishment growth outpaced growth in total employment and total businesses.

Workforce data signifies a need for the state to thicken its labor market in the areas of science and technology. In terms of occupations that are specifically related to science and engineering, in 2003, there were an estimated 15,020 science and engineering (S&E) occupations in Maine's workforce. On a per total worker basis, this was lower than that of the reference groups. Ph.D. recipients represent the underpinnings of an R&D based workforce. In 2003, there were an estimated 2,150 doctoral scientists and engineers in Maine's labor force. On a per total worker basis, Maine was slightly higher than the level in the EPSCoR states for the same year but trailed New England and the nation as a whole.

Gross state product and per capita income are the end outcome indicators for investing in research and development and supporting technology intensive industries. Between 2005 and 2006 Maine's gross state product growth was lower than all the reference groups. In 2006, Maine's per capita income was below that of all the reference groups. Taken together these two indicators point out that Maine has yet to reap the full potential of a technology-intensive economy.

High Technology Employment Growth

— performance summary —

Maine 1-Year Trend	N/A
Maine 5-Year Trend	N/A
Maine Compared to EPSCoR	↓
Maine's National Ranking	26

Summary

Between 2004 and 2005 high technology employment¹ grew 3.5 percent in Maine. This was a higher growth rate than that experienced in the U.S. as a whole (2.8 percent) and in New England (2.4 percent) but lagged that for the EPSCoR states (4.4 percent). Maine's technology related employment growth is outpacing its total employment growth. During the same period in Maine total employment in all industries decreased 0.4 percent.

Why This Is Significant

High technology job growth is an outcome indicator of Maine's ability to build, recruit and retain an educated and technically skilled workforce. It measures the level of employment opportunity created by the Maine economy. High technology jobs typically pay higher wages than non-technology related jobs. Therefore, employment growth in technology-intensive businesses helps increase the standard of living among Maine residents.

HIGH TECHNOLOGY EMPLOYMENT GROWTH

Related

In 2005 Maine had a total employment level of 594,481 workers. Of that amount, 20,828 or 3.5 percent were in high technology businesses. Maine's concentration of employment in high technology industries is lower than the concentrations in the reference groups. In 2005, 7.2 percent of U.S. employment was in high technology industries; in New England the concentration level was 8.5 percent; and among EPSCoR states, 5.3 percent.

Percent of Employment in High Technology Sectors 2001-2005

Sources

High technology and total employment were from special data tabulations of the County Business Patterns, U.S. Census Bureau, and U.S. Department of Commerce and were provided by the Center for Business and Economic Research, University of Southern Maine.

High Technology Business Establishment Growth

— performance summary —

Maine 1-Year Trend	N/A
Maine 5-Year Trend	N/A
Maine Compared to EPSCoR	↓
Maine's National Ranking	44

Summary

Between 2004 and 2005, high technology business establishments² in Maine increased 1.6 percent. During this period, high technology business establishment growth was lower in Maine and New England than in the other reference groups. In the U.S. as a whole the increase in high technology business establishments was 3.6 percent and among EPSCoR states, 5.4 percent. In New England the increase was identical to Maine at 1.6 percent. During this same period, Maine's growth in high technology establishments outpaced the growth of all business establishments in Maine, which experienced a decrease of 2.4 percent.

Percent Change in Establishments 2004-2005

Why This Is Significant

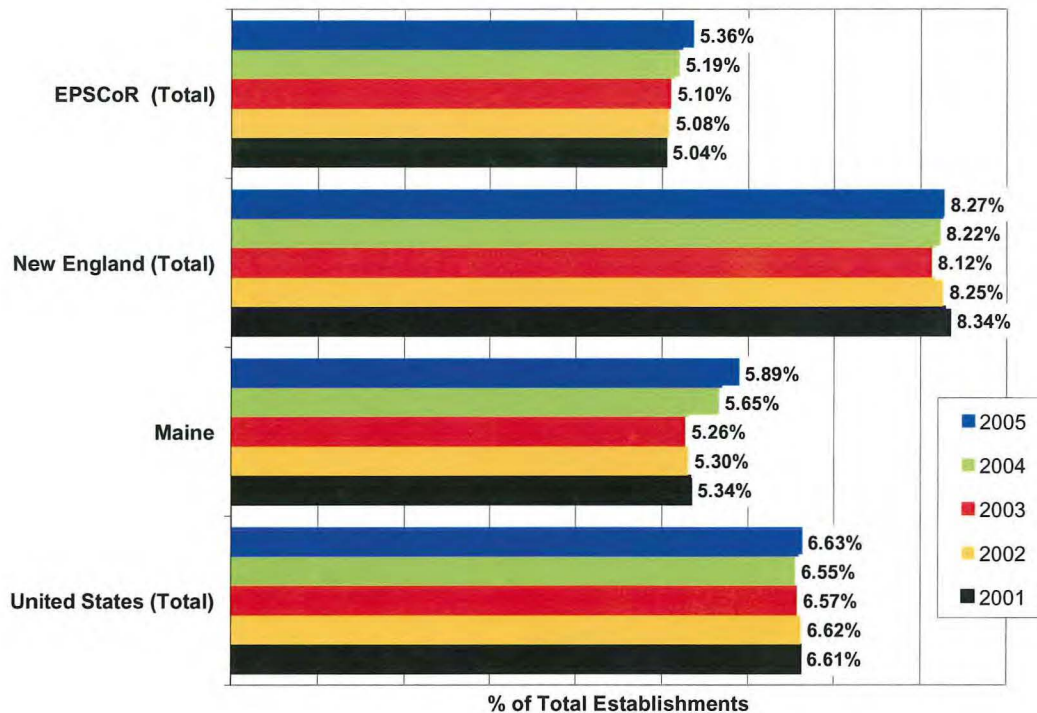

This indicator is a measure of how successful a region is at growing new technology businesses; ultimately, it is a measure of the concentration of high-technology in a state. It is an indication of a state's economic conditions, business climate, and availability of support for growth.

HIGH TECHNOLOGY BUSINESS ESTABLISHMENT GROWTH

Related

In 2005 high technology business establishments in Maine represented 5.9 percent of all business establishments. In 2005 in the U.S. as a whole, high technology business establishments represented 6.6 percent of all establishments; in New England, 8.3 percent; and among EPSCoR states, 5.4 percent. Based on the historical data Maine is making progress on catching up to the national average on this indicator.

Percent of Establishments in High Technology Sectors – 2001-2005

Sources

High technology and total establishments were from special data tabulations of the County Business Patterns, U.S. Census Bureau, and U.S. Department of Commerce and were provided by the Center for Business and Economic Research, University of Southern Maine.

Maine Compared to EPSCoR ↓

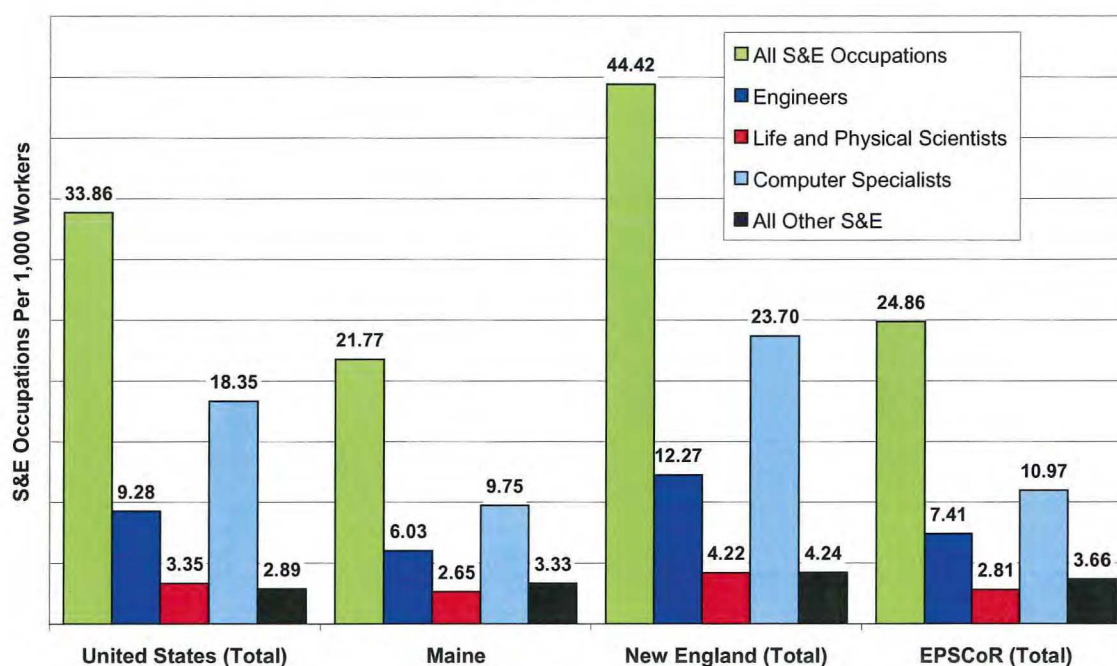

Maine's National Ranking 45

Scientists and Engineers in the Workforce

Summary

In 2003, there were an estimated 15,020 science and engineering (S&E) occupations in Maine's workforce.³ This represented 21.77 S&E occupations for every 1,000 Maine workers and lagged behind the U.S. as a whole (33.86), New England (44.42), and the EPSCoR states (24.86).

S&E Occupations in the Workforce Per 1,000 Workers – 2003

Why This Is Significant

A thick labor market of scientists and engineers is essential to creating a vibrant research, development and technology enterprise. This indicator is a measure of the state's ability to attract and retain highly skilled and highly educated workers who are critical to an innovation driven economy.

SCIENTISTS AND ENGINEERS IN THE WORKFORCE

Related

In 2003 the largest percent (45 percent) of S&E occupations in the Maine workforce were computer specialist occupations this was followed by engineers at 28 percent, and life and physical scientists at 12 percent. All other S&E occupations accounted for 15 percent. In relation to the reference group, Maine had a higher concentration of occupations in life and physical sciences.

Sources

Science and engineering occupations is from National Science Foundation, Division of Science Resources Statistics, Science & Engineering Indicators 2006, <http://www.nsf.gov/statistics/seind06/>; based on data from U.S. Department of Labor, Bureau of Labor Statistics, Occupational Employment and Wage Estimates; and Local Area Unemployment Statistics. Workforce is based on civilian labor force and is from U.S. Department of Labor, Bureau of Labor Statistics, Local Area Unemployment Statistics - <http://www.bls.gov/lau/home.htm>; 1990-2000 reflects new modeling approach and re-estimation as of March 2005; 2000-2005 reflects revised population controls and model re-estimation through 2005.

Ph.D. Scientists and Engineers in the Labor Force

— performance summary —

Maine 1-Year Trend	↑
Maine 5-Year Trend	↔
Maine Compared to EPSCoR	↑
Maine's National Ranking	29

Summary

In 2003, there were an estimated 2,150 doctoral scientists and engineers in Maine's labor force. This represented 3.1 doctoral scientists and engineers for every 1,000 Maine workers and was slightly higher than the level in the EPSCoR states (2.98) for the same year. However, Maine lagged behind New England and the nation as a whole. In 2003 New England had 6.6 employed doctoral scientists and engineers per 1,000 workers and the U.S. had employed 4.1.

Ph.D. Scientists & Engineers in the Workforce – 1995-2003

Why This Is Significant

Ph.D.s drive research and development leading to new products and services. They also provide vital linkages between Maine business and institutions with international R&D expertise. This indicator measures Maine's ability to attract and retain Ph.D. level workers.

Ph.D. SCIENTISTS AND ENGINEERS IN THE LABOR FORCE

Related

In 2003 the largest percent (21 percent) of employed Ph.D. scientists and engineers in the Maine workforce were employed in biology, agriculture, and other life science professions.⁴ This was followed by psychologists at 19 percent, and non-science and engineering professions. In relation to the reference group, Maine had a higher concentration of employed Ph.D. scientists in psychology professions and a lower concentration in engineering and computer science professions

Ph.D. scientists and engineers data is from National Science Foundation/Division of Science Resources Statistics, Survey of Doctorate Recipients 2003, and <http://www.nsf.gov/sbe/srs>. Workforce is based on civilian labor force and is from U.S. Department of Labor, Bureau of Labor Statistics, Local Area Unemployment Statistics - <http://www.bls.gov/lau/home.htm>; 1990-2000 reflects new modeling approach and re-estimation as of March 2005; 2000-2005 reflects revised population controls and model re-estimation through 2005.

— performance summary —

Maine Compared to EPSCoR ↓

Maine's National Ranking 48

Gross State Product Growth

Summary

Between 2005 and 2006 Maine's gross state product (GSP) grew 4.6 percent, a level that was lower than all the reference groups. During this same period, GSP grew 6.27 percent in the U.S. as a whole, 5.24 percent in New England, and 6.67 percent among the EPSCoR states combined. Maine also fell behind the United States and the EPSCoR states in the five-year and ten-year trends, but came in slightly above New England for the same periods of time.

Percent Change in Gross Domestic Product - State

Why This Is Significant

Gross state product is a comprehensive indicator of statewide total economic output. Growth in GSP relative to other states indicates a strengthening of a state's overall economy.

GROSS STATE PRODUCT GROWTH**Related**

In 2006 Maine's GSP exceeded \$46 billion. After a slow growth period in the early 1990's, GSP has since experienced steady growth in Maine.

**Sources**

Gross state product is from Bureau of Economic Analysis, U.S. Department of Commerce, 1980-1996 data; and Accelerated Estimates for 2006 and Revised Estimates for 1997-2005; <http://www.bea.gov/regional/gsp/>; 1997-2006 is based on NAICS while 1980-1996 is based on SIC industry classification.

Per Capita Income

— performance summary —

Maine 1-Year Trend	↑
Maine 5-Year Trend	↑
Maine Compared to EPSCoR	↓
Maine's National Ranking	40

Summary

In 2006, Maine's per capita income was \$31,931. This fell slightly below the EPSCoR states level of \$32,476 and fell further below that of the U.S. as a whole (\$36,629) and the New England level of (\$44,252).

Why This Is Significant

While GSP measures comprehensive economic performance, income is an indicator of individual wealth. It is in this sense that income is the ultimate end outcome for investing in science and technology: increasing personal wealth and therefore quality of life.

PER CAPITA INCOME

Related

Between 2005 and 2006 Maine's per capita income grew 3.6 percent, a level that was lower than all the reference groups. During this same period, per capita income in the U.S. as a whole grew 5.6 percent, in New England grew 5.9 percent and among the EPSCoR states combined grew 6.2 percent. Maine fell behind the reference groups over a 5-year and 10-year period as well, showing only a 44 percent change.

811212	Computer and Office Machine Repair and Maintenance

2 See note 1 for definition of high technology businesses.

3 S&E occupations are defined by NSF as 77 standard occupational codes that encompass mathematical, computer, life, physical, and social scientists; engineers; and postsecondary teachers in any of these S&E fields. People with job titles such as manager are excluded.

4 Occupation categories include: computer and information scientists; mathematical scientists; life and related scientists (biological and agricultural science, environmental sciences, health sciences); physical and related scientists (chemistry, earth, atmospheric, ocean, physics and astronomy); social and related scientists (economics, political science, sociology, and anthropology); psychology; and engineering (aerospace, aeronautical, chemical, civil, electrical, computer, materials, metallurgical, and mechanical).

indicators:

- Math and Science Skills of Students
- Higher Education Enrollment among Young People
- Science and Engineering Graduate Enrollments
- Science and Engineering Degrees Awarded
- Education Attainment

EDUCATION CAPACITY OVERVIEW

When asked about issues that have the greatest impact on business and economic development, the availability of a skilled and educated workforce is consistently among the top items cited by business owners, economic developers, and site locators. Moreover, technology and innovation based companies require workers with advanced skills and education in math and sciences.

Success in developing math and science skills begins at the K-12 level. Maine eighth grade students continue to perform well relative to other states in math and science. Maine's average math score in 2007 on the National Assessment of Educational Progress (NAEP) placed its eighth graders 12th in the nation; up from the 2005 level of 20th. In 2005, Maine eighth graders turned in the 9th highest *science* scores in the country on the (NAEP).

Today's science and technology intensive careers demand an education level beyond that of a high school level. In terms of advancing twelfth graders onto higher education, in 2004 Maine performed at the national average but below the New England states and the EPSCoR states in terms of chance for college enrollment among 19 year-olds. Data suggests that affordability of higher education for the typical Maine family is impeding Maine's progress in improving education capacity.

Supporting a vibrant technology and innovation economy requires a regular supply of workers with college and advanced degrees in science and engineering related fields. With regard to science and engineering enrollments and science and engineering degrees awarded Maine lags the nation, New England, and EPSCoR states.

Finally, with regard to the adult population, Maine has made significant progress. Compared to the reference groups, Maine was the only one that saw an increase from 2005 to 2006 on this indicator. In 2006, 27 percent of Maine's population twenty five years and older held four-year college degrees or more, up from 24 percent in 2005. In 2006 the level for the US as a whole was 27 percent, for New England, it was 33 percent, and for the EPSCoR states 24 percent.

Math and Science Skills of Students

math performance summary

Maine 5-Year Trend	↑
Maine Compared to EPSCoR	↑
Maine's National Ranking	12

Summary

The National Assessment of Educational Progress, (NAEP) provides data to allow a comparison of education achievement across states. On the 2007 NAEP mathematics test, Maine eighth graders scored 286.¹ This was higher than both 2003 (282) and 2005 (281).² Maine's score in 2005 placed its eighth graders at 20th in the nation; the 2007 score (286) elevated Maine students to 12th in the nation.

In 2007 Maine eighth graders nearly matched the scaled score of the other New England states (287), and scored higher than the US average scaled score (280) and that of the EPSCoR states (278).

science performance summary

Maine 5-Year Trend	↔
Maine Compared to EPSCoR	↑
Maine's National Ranking	9

**National Assessment of Educational Progress – Math Scores
(Average Scale Scores) for 8th Graders – 2003, 2005, 2007**

On the 2005 NAEP, Maine eighth graders turned in the ninth highest science scores in the country. Maine's average score was 158 compared to 147 for the US, 157 for New England, and 148 for the EPSCoR states.³

MATH AND SCIENCE SKILLS OF STUDENTS

Why This Is Significant

Proficiency in both math and science is a fundamental requirement for technology-related jobs. The NEAP helps to measure performance in math and science among eighth graders in Maine and because it is conducted nationally allows comparisons among states.

Sources

U.S. Department of Education, Institute of Education Sciences, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), 2000 & 2005 Science Assessments and 2000, 2003, 2005 and 2007 Mathematics Assessments; <http://nces.ed.gov/nationsreportcard/>

Higher Education Enrollment among Young People

— performance summary —

Maine 5-Year Trend	↓
Maine Compared to EPSCoR	↓
Maine's National Ranking	29

Summary

In 2004, Maine 19 year-olds had a 38.1 percent chance⁴ of being enrolled in post-secondary education. This represents little change from the state's 2002 level of 38.5 percent. On this indicator in 2004 Maine performed at the national average but below the New England states (41.6 percent) and the EPSCoR states (40.1 percent).

Chance for College Enrollment by Age 19 – 1992-2004

Why This Is Significant

Higher education attainment among the population is increasingly important if Maine is to develop a technology-intensive economy and one that promotes personal economic well-being. The extent to which young adults complete high school and continue to higher education is an indicator of aspirations among young adults, and accessibility of higher education, and future potential education attainment.

Related

Chance for college at the end of high school is a factor of both high school graduation and college continuation rates. In 2004 Maine's public high school graduation rate was 76.8 percent. This was similar to the New England average of 76.2 percent and higher than that for the U.S. as a whole (68.8 percent) and the EPSCoR states (69.9 percent).

HIGHER EDUCATION ENROLLMENT AMONG YOUNG PEOPLE

In 2004 Maine's college continuation rate was 49.6 percent. This is lower than all the reference groups with the U.S. at 55.5 percent, New England at 54.8 percent, and EPSCoR at 57.2 percent.

HIGHER EDUCATION ENROLLMENT AMONG YOUNG PEOPLE

Taken together, the high school graduation rate and college continuation rate for Maine students indicate that while Maine is graduating its high school students at higher than average rates, it is not leading to higher than average college enrollments of young people. Further investigation reveals that this may be more related to affordability rather than aspirations. In 2005-06, a higher percentage of the typical Maine family's income was needed to pay for college than all the other reference groups.

Percent of Family Income Needed to Pay for College – 2005-06

Sources

Data on chance for college is “Chance for College by Age 19 - 1986-2004”, Thomas Mortenson, Postsecondary Education Opportunity; 9/25/2006; <http://www.postsecondary.org> and is based on data from data from Public Elementary and Secondary Education Statistics and the biannual Integrated Postsecondary Education Data System of the National Center for Education Statistics, www.nces.ed.gov. Data on affordability is from National Center for Public Policy and Higher Education; “Measuring Up 2006: The State-By-State Report Card for Higher Education”; <http://measuringup.highereducation.org>.

Science and Engineering Graduate Enrollments

— performance summary —

Maine 1-Year Trend	↔
Maine 5-Year Trend	↑
Maine Compared to EPSCoR	↓
Maine's National Ranking	51

Summary

In 2005 Maine had 744 graduate students enrolled in science and engineering programs. This represented 0.56 enrolled graduate students per 1,000 residents. On this indicator in 2005 Maine lagged the indices of the US (1.95), New England (3.01), and EPSCoR (1.51).

S&E Graduate Student Enrollments per 1,000 Residents – 1996-2005

Why This Is Significant

The extent to which Maine colleges and universities are awarding science and engineering degrees is an indicator of both the science and technical capacity of the state's postsecondary schools and the potential for workers with science and technical abilities among Maine's workforce. Both of these are fundamental requirements for developing a solid foundation for research and long-term, technology-driven innovation. The National Science Foundation, the National Institutes of Health, and the Council of Graduate Schools also emphasize the importance of graduate level studies in these disciplines: "The goal that national science workforce policy seeks or needs to maximize is to produce high quality researchers as quickly and cheaply as possible. [It] emphasized that graduates enrolled in science and engineering fields more than those enrolled in other disciplines would likely remain connected to their chosen field: Most master's recipients [in science and engineering disciplines] were continuing in science and engineering-related employment or education...and those recipients with the highest GPAs were much more likely than other master's recipients to stay in science and engineering fields."⁵

SCIENCE AND ENGINEERING GRADUATE ENROLLMENTS**Related**

Maine colleges and universities were host to 744 students who were pursuing graduate degrees in science and engineering disciplines in 2005. Although this was an increase since 2000, it demonstrated a significant decrease in such students since 1995 when 884 students studied graduate level degrees in science and engineering disciplines. Enrollment since 1996 show that all three other comparative units (US, New England, and EPSCoR) succeeded in increasing the enrollment of students in science and engineering graduate degrees while Maine's enrollment decreased by 15.8 percent.

S&E Graduate Enrollments in Maine – 1996-2005**Sources**

S&E Graduate Students were extracted from NSF WebCASPARD Database System based on “Survey of Graduate Students and Post-doctorates in Science and Engineering”, National Science Foundation and National Institutes of Health. Population for 1995 through 1999 is from April 1, 1990 to April 1, 2000; Population Division, U.S. Census Bureau; Release Date: April 11, 2002; July 2000-July 2006 -Table 1: Annual Estimates of the Population for the United States and States, and for Puerto Rico: and 2000-2005 is from April 1, 2000 to July 1, 2006 (NST-EST2006-01), Population Division, U.S. Census Bureau, Release Date: December 22, 2006.

Science and Engineering Degrees Awarded

— performance summary —

Maine 1-Year Trend	↑
Maine 5-Year Trend	↑
Maine Compared to EPSCoR	↓
Maine's National Ranking	30

Summary

In 2005 Maine colleges and universities awarded 3,681 degrees⁶ in science and engineering disciplines. This represented 2.79 science and engineering degrees per 1,000 Maine residents. In 2005 Maine's level on this indicator was lower than the national level of 2.81 the New England level of 3.24, and the EPSCoR level of 2.84.

S&E Degrees Awarded per 1,000 Residents – 1996-2005

Note: 1999 data is unavailable

Why This Is Significant

The extent to which Maine colleges and universities are awarding science and engineering degrees is an indicator of both the science and technical capacity of the state's postsecondary schools and the potential for workers with science and technical abilities among Maine's workforce. Both of these are fundamental requirements for developing a solid foundation for research and long-term, technology-driven innovation.

Related

Of the 3,681 science and engineering degrees awarded in Maine in 2005, 553, or 15 percent, were masters degrees or higher. The growing importance of advanced degrees was reflected in the award trend data: the number of graduate degrees (masters or higher) awarded in science and technology has increased steadily from a level of 8.76 percent in 1995.

SCIENCE AND ENGINEERING DEGREES AWARDED

Master's or Higher S&E Degrees Awarded in Maine – 1995-2005

In terms of the academic disciplines in which degrees were awarded by Maine and the U.S. in 2005, compared to the U.S. Maine had a higher concentration in life sciences and lower concentrations in engineering, math and computer sciences.

Science & Engineering Degrees by Discipline – 2005

SCIENCE AND ENGINEERING DEGREES AWARDED**Sources**

S&E degrees awarded were extracted from NSF WebCASPAR Database System, <http://webcaspar.nsf.gov>, based on the Higher Education General Information Survey and Integrated Post-Secondary Education Data System, National Center for Education Statistics, U.S. Department of Education, www.nces.ed.gov. (Data for 1999 was unavailable.). Population for 1995 through 1999 is from April 1, 1990 to April 1, 2000; Population Division, U.S. Census Bureau; Release Date: April 11, 2002; July 2000-July 2006 -Table 1: Annual Estimates of the Population for the United States and States, and for Puerto Rico: and 2000-2005 is from April 1, 2000 to July 1, 2006 (NST-EST2006-01), Population Division, U.S. Census Bureau, Release Date: December 22, 2006.

Education Attainment

— performance summary —

Maine 1-Year Trend	↑
Maine 5-Year Trend	↑
Maine Compared to EPSCoR	↑
Maine's National Ranking	25

Summary

Maine has recently made significant progress on this indicator. Compared to the reference groups, Maine was the only one that saw an increase from 2005 to 2006 on this indicator. In 2006, 27 percent of Maine's population twenty-five years and older held four-year college degrees or more, up from 24 percent in 2005. In 2006 the level for the US as a whole was 27 percent, for New England, it was 33 percent, and for the EPSCoR states 24 percent.

**Percent of Population 25 Years and Older
Who Have a Bachelors Degree or More 1997-2006**

Why This Is Significant

Analysis conducted by the Maine State Planning Office as part of *30/1000 Initiative* reveals that the economic well-being of a state is strongly tied to two factors: (1) the percent of the population with a bachelor's degree or higher, and (2) the level of expenditures for research and development. This analysis is supported by national research.⁷ Wages are typically higher in technology-intensive industries; these are the same industries that increasingly require workers with higher education degrees. In terms of income of the average person, income levels are considerably higher for persons with college and advanced degrees.

EDUCATION ATTAINMENT

Related

In terms of the percentage of the population 25 years and older who have graduated from high school, in 2006 Maine ranks 18th among all states. Maine's percentage of 89.3 percent placed Maine higher than the nation as a whole (84.1 percent), higher than the EPSCoR states (86.3 percent), and slightly higher than the New England states (89.0 percent).

**Percent of Population 25 Years and Older
That Have Completed High School 1997-2006**

- 6 Degrees and awards earned but not yet conferred by branch institutions located in foreign countries, and of an honorary nature are not included; Includes the science fields of engineering, physical sciences, geosciences, math and computer sciences, life sciences, medical sciences, and science and engineering technologies; Excludes psychology, social sciences, and interdisciplinary sciences; Includes associate’s, bachelor’s, master’s, first professional, and doctorate level degrees and certificates
- 7 The Mortenson Research Seminar on Public Policy Analysis of Opportunity for Postsecondary Education, www.postsecondary.org for further analysis on this subject.

indicators:

- Household Connectivity
- High Speed Internet Access
- Classroom Connectivity

CONNECTIVITY CAPACITY OVERVIEW

The Internet has transformed every segment of society, from families to schools to businesses, from communities to states and nations. The ability to use the Internet represents the ability to connect, communicate and participate directly in innovation.

Maine's experience with connectivity varies. Relative to the U.S. as a whole and the EPSCoR states, Maine households have higher access to the Internet. However in terms of high speed access, Maine has fewer high speed Internet lines per 1,000 residents than its U.S. and New England counterparts.

In terms of classroom connectivity, fueled by the laptop initiative and local and state investments in technology, Maine continues to be a leader with more Internet computers per students and greater use of computers and the Internet by teachers compared to the reference groups.

Household Connectivity

— Performance Summary —

Maine 1-Year Trend	↑
Maine 3-Year Trend	↑
Maine Compared to EPSCoR	↑
Maine's National Ranking	15

Summary

In 2003, 57.9 percent of Maine households had access to the Internet. Maine and New England (59.7 percent) lead the U.S. as a whole (54.6 percent) and the EPSCoR states (51.1 percent). Maine's 2003 level is a considerable increase since the 2000 level of 42.6 percent.

Percent of Households With Internet Access – 2000-2003

Why This Is Significant

Household Internet access provides citizens with the opportunity to utilize the Internet for business, education and personal uses 24 hours a day. The Internet is gaining increasing significance as a means of information exchange, communications, business transactions and research. This indicator measures the ease with which Maine citizens can access this information tool compared to the rest of the nation.

Related

Maine citizens were better equipped for computer use than the nation as a whole. In 2003, it was estimated that 67.8 percent of Maine households (up from the 2000 level of 54.7 percent) had computer access at home, compared to 61.8 percent nationwide. In 2003, Maine also had higher computer access than the average for New England households, 66.7 percent, and the average for households in EPSCoR states, 59.7 percent.

HOUSEHOLD CONNECTIVITY

Percent of Households With Computers – 2000-2003

High Speed Internet Access

— Performance Summary —

Maine 1-Year Trend	↑
Maine 5-Year Trend	↑
Maine Compared to EPSCoR	↑
Maine's National Ranking	37

Summary

Maine has seen a significant increase in broadband¹ Internet subscribers,² from 17,864 in 2000 to 305,883 in 2006. This represented an increase of 1,065 percent. Relative to the U.S. and New England, Maine had fewer subscribers per 1,000 residents. In 2006, there were 231 Internet lines per 1,000 residents in Maine compared to 276 in the U.S. as a whole and 334 in New England. During the same year Maine was higher than the EPSCoR level of 214 lines per 1,000 residents.

**High Speed Internet Lines (Subscribers) per 1,000 Residents
2000-2006**

Why This Is Significant

The degree to which broadband technology is available and used in Maine determines, to a significant extent, the degree to which Maine is technologically competitive. For instance, companies that rely on e-commerce for sales transactions, as an example, require broadband technology. Likewise, entities engaged in research and development require high capacity communications technology.

According to the American Electronics Association, an organization of more than 3,000 companies engaged in aspects of high technology, "Widespread broadband deployment will have a positive effect on many areas of everyday life, ranging from communications, entertainment, and healthcare to education and job training."

HIGH SPEED INTERNET ACCESS

High Speed Internet Lines (Subscribers) in Maine – 2000-2006

Related

In terms of the method of high speed Internet access used in Maine, in 2006 cable is dominant with 50 percent of high speed lines compared to 35 percent for digital subscriber lines (DSL).³

**High Speed Internet Lines (Subscribers) by Type
2006 – Maine**

Source

Internet line data is from “High-Speed Services for Internet Access: Status as of December 31, 2006”, October 2007, Federal Communications Commission; <http://www.fcc.gov/wcb/iatd/comp.html>.

Classroom Connectivity

— Performance Summary —

Maine 1-Year Trend	↑
Maine 5-Year Trend	↑
Maine Compared to EPSCoR	↑
Maine's National Ranking	2

Summary

Maine continues to be a leader with regard to access to computers and the Internet in the classroom. In 2006, there were 1.94 students per Internet connected computer in Maine compared to 3.65 in the U.S. as a whole, 3.44 in New England, and 3.40 among EPSCoR states.⁴ Maine's program to provide a laptop to every 7th grade student made it one of a few states in the nation that have classroom laptop programs.

K-12 Students Per Internet Connected Computer – 2000-2006

Why This Is Significant

The Internet provides access to research and information that can enhance classroom curriculum at every grade level. Easy access to Internet-connected computers is needed for teachers to effectively incorporate information technologies into the learning environment. Computer literacy is increasingly becoming a minimum requirement of employers. In 2000, 64 percent of Maine businesses surveyed indicated that computer literacy of high school graduates was critically important.⁵
