Characteristics of Work-Related
Injuries and Illnesses in Maine
1977

Introduction

The tabulations presented in this publication are the results of the Supplementary Data System. The data are obtained from Employer's First Reports of Occupational Injury or Occupational Illness (ME Form 21) submitted to the Maine Industrial Accident Commission ^{1/}. Data were collected by the Maine Department of Manpower Affairs, Bureau of Labor, Research and Statistics Division. The S.D.S. Program is a Federal/State cooperative effort in conjunction with the U.S. Department of Labor, Bureau of Labor Statistics.

Summary

There were 43,828 First Reports submitted to the Industrial Accident Commission during 1977 ^{2/}. Of these reports, less than four percent were for occupational diseases ^{3/}. Cuts, Lacerations, and Punctures (23.5%) and Strains and Sprains (22.9%) were the most prevalent Natures of Injury or Illness reported. Over one-third of the incidents involved the upper extremities, especially the fingers which were cited in nearly 20% of the reports. Source of Injury or Illness named varied greatly. The largest single category was working surfaces with approximately 11%. The Type of Accident or Exposure most often reported was Struck By (23.3%), although Struck Against and Overexertion (both with nearly 15%) were major problems.

^{1/} Renamed Workers' Compensation Commission, July 6, 1978.

^{2/} Received by April 15, 1978.

^{3/} See Appendix B for list of inclusions.

Individuals involved were most likely to be employed in an Industry from the Manufacturing Division (43.9%). About one in five of the affected employees were women. In nearly one quarter of the cases, the injured or ill person's Occupation was classified as an Operative. Most of the incidents (37.6%) occurred within one year of beginning employment with over 70% of those happening in the first six months. Overall, 35.2% of the cases were disabling, that is, they resulted in at least one lost workday.

Nature of Injury or Illness

This classification identifies the injury or illness in terms of its principal physical characteristics. As noted in the summary, Cuts, Lacerations and Punctures, and Strains and Sprains make up the bulk of the Natures. Other important Natures were Contusions and Bruises (18.2%), Fractures (5.3%), and Scratches and Abrasions (4.5%).

Occupational Illnesses ^{1/}	1,593	3.6
Other Occupational Injuries ^{2/}	9,500	21.7

^{1/} See Appendix B

^{2/} Including Unclassified

Fractures, although fewer in number, are more likely to involve lost workdays than any other major category. Strains and Sprains also resulted in disabling injuries in more than half of the cases. Occupational Illnesses had virtually the same percentage of disabling cases (35.3%) as the overall rate.

Part of Body Affected

This set of codes identifies the part of the person's body affected by the previously coded Nature. While the largest number of reports involved the Upper Extremities, the Head, Trunk and Lower Extremities were named as the affected part in more than 10% of the cases. As with the Upper Extremities, the Head and Trunk had specific members which were problem areas. The Eyes were named in 10% of the cases and in nearly two-thirds of injuries or illnesses affecting the Head, while the Back was affected in 13% of the cases and over 60% of the reports involving the Trunk.

In terms of severity, only the Trunk, particularly the Back, reported more disabling than non-disabling injuries. Likewise, problems affecting the Lower Extremities had a higher percentage of cases involving lost workdays than the overall rate. On the other hand, injuries and illnesses of the Upper Extremities, despite their large numbers, showed an incidence of disabling cases (27.9%) lower than the rate for all cases (35.2%).

Source of Injury or Illness

The Source also relates directly to the previously selected Nature and identifies the object, substance, exposure or bodily motion which produced or inflected the injury or illness. Only two Sources were identified in more than 10% of the cases, Metal Items and Working Surfaces, although the total for all Hand Tools was in excess of this figure. Additionally, five other categories, Bodily Motion, Containers, Machines, Vehicles, and Wood Items were listed as the Source in more than two thousand cases.

Not only were the various Working Surfaces the leading Source, they had a rate of lost workday incidents significantly higher than the overall rate. This was especially true of Working Surfaces other than floors. Bodily Motion, Powered Hand Tools, and Containers yielded disabling injuries or illnesses in more than 40% of the cases in which they were the source.

Type of Accident or Exposure

The object of this classification is to identify the event which directly resulted in the injury or illness. As noted in the summary, over half of the cases involved the injured person being Struck By an object, Struck Against an object, or there was indication of Overexertion in some form. Falls, either from elevation or on the same level, were significant contributors with a combined total of almost 14%. The Caught In, Under or Between, and the Rubbed or Abraded categories also had significant numbers.

Falls from Elevation and Overexertion resulted in lost workdays in over half of the cases in which they occurred, while Falls on the Same Level were disabling 40% of the time. On the other hand, most of the other major categories were disabling less than 35% of the time. Struck Against and Rubbed or Abraded were disabling in only one quarter of the cases or less.

Industry

Aside from Manufacturing, there were four other Industry Divisions that had a substantial number of occurrences of injuries or illnesses. These were State and Local Government, Services, Construction and Retail Trade. Of these five divisions, only Manufacturing and Construction had a greater percentage of reports than their share of the labor market. Wholesale Trade also exceeded its percentage of employment but to a lesser degree.

Text Table E-2 shows the ten largest Major Industry Groups in terms of the number of Reports. This higher level of detail parallels the Industry Divisions. The Construction and Manufacturing industries have a higher percentage of injuries and illnesses than employment, while the other industries show the reverse.

In terms of disabling injuries, there is little difference among the Industry Divisions with a large number of cases. All of them tend to group around the overall rate. The Major Industries also have this tendency. The sole exception is Lumber and Wood Products which approaches fifty percent disabling.

Occupation and Age

Operatives (except Transportation Operatives), Craftsmen and Kindred Workers, and Laborers (except Farm Laborers) combined account for over two-thirds of the reported cases.

Only two other occupational groups, Service Workers and Transportation Equipment Operatives, had more than 2000 occurrences of injuries or illnesses. The ages of the individuals involved ranged from eight to 84 with a median age of 29. The median age of each occupation falls in the 25-34 years range. With one exception, this was also the largest age group in each major occupational category. For laborers, the largest group was 20-24 years.

Most of the occupational groups were in the 30-36% range in terms of percentage of disabling incidents. Two exceptions were Transportation Equipment Operatives and Laborers both having over 40% lost workday cases. On the other hand, the Professional, Technical group was less than 26% disabling.

Duration of Employment

Over one third of the cases for which the length of service was determined

involved employees who had worked less than six months for that employer. Those with five years experience or less accounted for 75% of the cases with a known duration of employment.

The duration of employment does not appear to be a factor where severity is concerned. All of the groups exhibited a distribution of disabling injuries or illnesses similar to the overall rate. The unknown group has a large percentage of non-disabling reports but this may be because these reports tend to be less complete.

TECHNICAL NOTES

Under the Maine Workmen's Compensation Act^{1/} and the Occupational Disease Law,^{2/} employers^{3/} must file a First Report of Occupational Injury or Occupational Illness (ME Form 21) or its equivalent within seven days for each incident which resulted in the loss of at least one day's work or which required the services of a physician.^{4/} Also a significant number of voluntary reports are filed that do not meet these conditions but are submitted to protect the rights of both parties in case of later complications. As the reports are received they are assigned a number which serves as a unique identifier of that particular case.

The First Reports are then coded by the staff of the Research and Statistics Division, Bureau of Labor for the fifteen data elements shown in the table below.

This report must bear your handwritten signature.

You must show your name at the top of the report exactly as it is on your workmen's compensation insurance policy and your address must be complete.

Kind of business, etc. should be completely accurate. This information is used for statistical purposes.

Employee's name must be clear and his address must be complete and accurate.

If incapacity did not begin at once, but at some later date, be sure to state the last full day worked. We also must know the exact number of hours for which the employee was paid on the date of injury. If the employee has returned to work at the time you are making out this report, be sure to show the date he returned to work.

13. Enter regular job title as well as the specific activity he was performing at time of injury.
14. Enter name of department or division in which the injured person is regularly employed, even though he may have been temporarily working in another department at time of injury.
22. Be specific. If he was using tools or equipment or handling material, name them and tell what he was doing with them.
23. Describe fully the events which resulted in the injury or occupational illness. Tell what happened and how it happened. Name any objects or substances involved and tell how they were involved. Give full details on all factors which led or contributed to the injury. Use separate sheet for additional space.
24. E.G.: amputation of right index finger at second joint; fracture of ribs; lead poisoning; dermatitis of left hand, etc. In hand injuries, show major or minor hand.
25. For example, the machine or thing he struck against or which struck him; the vapor or poison he inhaled or swallowed; the chemical or radiation which irritated his skin; or in cases of strains, hernias, etc., the thing he was lifting, pulling, etc.

AMERICAN NATIONAL STANDARDS INSTITUTE

Z16.2 SYSTEM (MODIFIED)

Injury and illness characteristics are coded using the ANSI Z16.2 method of recording basic facts relating to the nature and occurrence of work injuries. A number of changes have been made to this system to either allow for more detail or to meet special needs of the S.D.S. program. The list of tables that follows notes these changes. The meaning of each notation is shown below.

New: A new category created specifically for S. D. S.

Expanded: 3 or 4-digit codes created to allow more detailed coding or where 3 or 4-digit codes have been added to existing codes.

Modified: Content or definition change

Occupational Illnesses

The category Occupational Illness, shown in Text Tables A-1 and A-2 is identical to a similarly titled category created by the Bureau of Labor Statistics for use in the detail tables listed in Appendix C.
