PREFACE

The statistics in this publication are the results of the Supplementary Data System (SDS), a cooperative program involving the Maine Department of Labor, Bureau of Labor Standards, Division of Research and Statistics, the Maine Workers' Compensation Commission, and the U.S. Department of Labor, Bureau of Labor Statistics, Office of Safety and Health Statistics.

Maine's participation in the SDS program began in 1977. Published data on work-related injuries and illnesses extends back through that year, though supplies of publications for years 1979 through 1983 have been depleted. More detailed tables and special studies are also available. See appendix B for ordering information.

For the most part, the tables and charts within show two series of numbers, those for ALL cases and those for DISABLING cases. When First Reports of Workers' Compensation are coded, they are assigned one of four severity codes: 1) Fatal; 2) Disabling (one or more lost workdays beyond the date of injury or onset of illness); 3) Nondisabling and 4) Unknown (not reported). The information in this publication is from reports received by the Workers' Compensation Commission through October 30, 1986, for incidents which occurred during calendar year 1985.

The goal of this publication is simplicity. It is our hope that everyone will be able to understand the statistics by following the charts and graphs and by reading the short narratives which accompany them. If you have any comments or suggestions that might improve the usefulness or readability of the data, please contact the Department of Labor, Bureau of Labor Standards, Division of Research and Statistics, Station #45, Augusta, Maine 04333.

The Workers' Compensation Commission has a new computer system which became operational in late 1984. The change in processing data combined with a late start in becoming automated resulted in no publication for that year. Much of the data is coded and ready for entering into the system, however a lack of staff-time will delay availability of the data until a much later date. Any 1984 figures in this publication other than the total number of First Reports recieved are estimates.

There was a dramatic increase in the number of First Reports of Injury or Illness filed with the Workers' Compensation Commission in 1984 over those filed in 1983. Specifically, there were 49,214 reports filed in 1983 and 63,765 reports filed for the year 1984 (as of October 30, 1986). This represents a 29.6% increase. Two factors were at work here, a healthy increase in employment and the change to an "early pay" system.

The number of job-related fatalities for 1985 stood at 45. This represents an increase over 1983 figures and should also be higher than the number of fatalities for 1984. In 1983, 36 work-related fatalities were reported and in 1984, 27 fatalities have been coded though it is possible there are more that have not yet been processed.

(53.1%)

The bar graph below illustrates the dramatic increase in First Reports received by the Workers' Compensation Commission in 1984 over any previous year. Receipts for 1985 were slightly higher than for 1984. In 1985, one report was filed for every 7 workers in the labor force. This is not to say that every seventh employee filed a report, because some individuals filed more than one.

It is interesting to note that the percentage of disabling reports to total reports dropped in 1985 as compared to any year since 1979. For every year between 1979 and 1983, the percentage of disabling cases to total cases was between 38% and 39%. For 1985, the percentage was 36.4%. The number of disabling cases for 1984 is an estimate.

Figure 1. — Number of First Reports, Maine, 1981—1985

(All Numbers in Thousands)

PART I

CHARACTERISTICS OF THE INJURED OR ILL WORKER

SEX

As shown in the table below, men accounted for 53.5% of the total employment and 72.5% of the work-related injuries and illnesses in 1985. Women accounted for 46.5% of the total employment and 27.5% of the work-related injuries and illnesses. This disparity is, for the most part, attributed to the fact that men tend to occupy higher risk occupations.

Between 1982 and 1984 average annual female employment dropped. In 1985, average annual employment for women rose by nearly 8,000 over 1984, however; average annual employment for women is still below the 1982 level.

The percentage of reports filed by women has increased every year since the start of the SDS program in 1977. That year 21% of the work-related injuries and illnesses were reported by women. As previously mentioned, the 1985 figure was 27.5%. This upward trend may in part be attributed to women now holding some positions that were traditionally held by men.

TABLE 1. -- AVERAGE EMPLOYMENT & NUMBER OF REPORTS BY SEX, MAINE, 1985

OCCUPATION

A workers' occupation is one of the best indicators of whether or not he or she will have a work-related injury or illness. Injuries and illnesses are highly concentrated in certain occupational groups: 1)Precision Production, Craft, and Repair occupations (including all mechanics, construction trades workers, precision metal workers, and plant and system operators); 2) Machine Operators, Assemblers, and Inspectors; 3) Handlers, Equipment Cleaners, and Laborers (including all trades helpers, machine feeders and offbearers, stock clerks, and packers); and 4) Service occupations. No attempt should be made to compare these figures with those for 1983 because a new occupational classifying system came into effect in 1985.

There has been much discussion in recent years concerning safety training for young workers because they are involved in the majority of work-related injuries. The statistics continue to show that training of young workers should be a priority. In the table below, a ratio has been calculated by dividing the percentage of reports filed within age groups by sex by the percentage of the labor force within age groups by sex. A ratio of 1.00 would indicate that the number of reports filed were in line with the employment. Numbers greater than one would indicate that the number of claims filed are greater than expected. The ratio for 20-24 year-olds in both sexes was very high as was the ratio for men between the ages of 25 and 34.

LENGTH OF SERVICE

Among those people filing First Reports of Occupational Injury or Illness, individuals in the Protective Service Occupations, including police and fireman, and the Executive, Administrative, and Managerial Occupations had the greatest longevity with their employer. Conversely, workers in Household Occupations, including cleaning, cooking, and laundering, and workers in the Farming, Fishing, and Forestry Occupations had spent relatively short periods of time working for their current employer.

TABLE 4. -- AVERAGE LENGTH OF SERVICE, ALL CASES, MAINE, 1985

PART II

CHARACTERISTICS OF THE FIRM

OWNERSHIP

In 1985, private employers filed 90% of all First Reports. The remainder were filed by local government (6.9%) and the State (3.1%). It is important to remember that there are different jurisdictions for the enforcement of Occupational Safety and Health rules and regulations. The U.S. Department of Labor, Occupational Safety and Health Administration (OSHA) covers private employers while the Safety Division of the Maine Bureau of Labor Standards covers both the State and Local governments.

Due to the widely divergent nature of work performed in private and public sectors, it is inadvisable to make comparisons between them. Such comparisons may lead to inaccurate judgements as to the performance of the enforcing agencies.

In terms of the total number of reports filed in 1985, only State government remained virtually the same as it did in 1983. Both the private sector and local governments had substantial increases. All employer units had increases in the number of disabling cases reported.

TABLE 5. -- PERCENT AVERAGE EMPLOYMENT & PERCENT REPORTS
BY OWNERSHIP, MAINE, 1985

 ⁵⁰URCE: Division of Economic Analysis & Research, Bureau of Employment Security, Department of Labor.

INDUSTRY

Virtually every industry division has experienced increases in the number of total cases and the number of disabling cases since 1983. Most of the increases occurred between 1983 and 1984. In the table below, a ratio of 1.00 means that the number of reports filed in a particular industry are in line with the employment in that industry. The Construction Trades and Manufacturing had ratios much higher than 1.00, indicating hazardous work environments. Public Sector divisions, Services, and Finance, Insurance, and Real Estate are among the least hazardous industries in which to work.

^{3.} Percent of Disabling Cases divided by percent of average employment.

MANUFACTURING

The Food Products and Lumber and Wood Products industries had the highest ratios of reports to employment and of disabling reports to employment. Conversely, the Printing and Apparel Making industries had the lowest ratios. The Leather industry, which has experienced a large decrease in employment in recent years, also had a low ratio. Large gains in employment have occurred in the Electric and Electronic Equipment manufacturing industry, but the ratio is still well below 1.00. The very physical nature of some jobs in the Manufacturing industry combined with the use of hand tools and machinery make the Manufacturing industry second only to Construction in terms of the number of reports filed exceeding the number expected.

INSURANCE

The majority of employees injured in Maine are covered by private Workers' Compensation insurance. Next are those covered by self-insurance, which account for 21% of all First Reports. A smaller number of employees have no Workers' Compensation insurance. Figures for 1985 that show 10.7% of all employees filing reports had no coverage are over-stated, but are the best available. This is because some companies have been late in renewing insurance and some have failed to notify the Workers' Compensation Insurance Coverage Section in a timely manner.

TABLE 8. -- REPORTS, NUMBER & PERCENT BY INSURANCE TYPE, MAINE, 1985

	A11 R	eports	Disabling	Reports	
Insurance Method	Number	Percent	Number	Percent	
ALL	64,033	100.0%	23,296	100.0%	
Private	43,770	68.4	16,361	70.2	
Self-Insured	13,416	21.0	4,519	19.4	
Not Insured	6,847	10.7	2,416	10.4	

The three counties with the greatest number of reports filed were Cumberland, Penobscot, and York. These three counties were also among the top four in terms of average employment. To place things in better perspective, divide the percent of reports by the percent of employment. A ratio of 1.00 means that the number of reports filed in the county are in line with the employment.

As seen in the table, the number of reports filed in Cumberland, Penobscot, and York counties are not disproportionate when compared to the average annual employment. Six counties that had ratios of well over 1.00 were Franklin, Hancock, Oxford, Sagadahoc, Somerset, and Waldo. High ratios tend to indicate a concentration of hazardous industries in given county.

Percent of All Cases divided by the percent of average annual employment.

Percent of Disabling Cases divided by the percent of average annual employment.

PART III CHARACTERISTICS OF THE INCIDENT

DAY OF THE WEEK

As expected, 89.4% of all injuries and illnesses occur on weekdays. The highest number of reported cases were for injuries or illnesses that occurred on Mondays. It is interesting to see how the number of reported cases dropped each day throughout the week.

FIGURE 2. -- DAY OF THE WEEK, NUMBER & PERCENT ALL CASES, MAINE, 1985 (All Numbers in thousands)

REPORTS

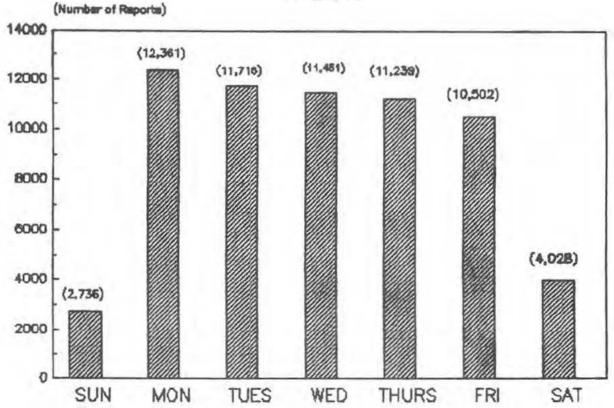

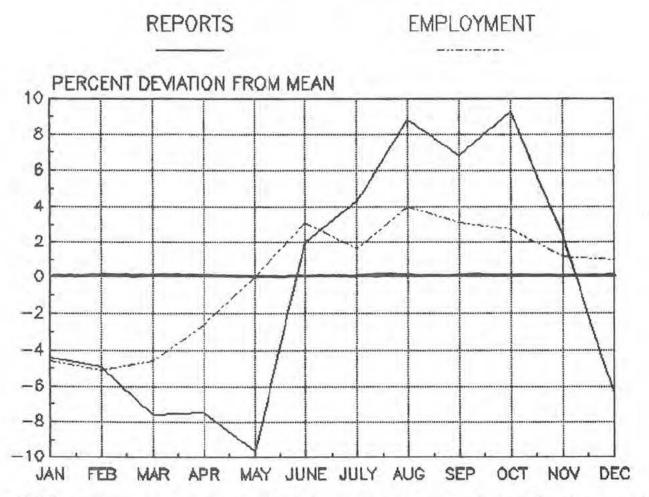

Figure 3 illustrates the relationship between the number of reports received per month and the employment per month. Because the number of workdays in each month differs, the number of reports received were adjusted to reflect what the number of receipts would be based upon the average number of workdays in a month (total workdays per year/12). Weekends and holidays were not included. Employment figures were not adjusted because they reflect actual employment in a month and are not subject to change due to the differing number of workdays.

Generally, the deviation in the number of reports received in a month from the mean number of reports received per month over the year was greater than the deviation in monthly employment from the mean annual employment. In March, April, and May, employment in logging and woodswork decreases leading to a reduction in the number of reports filed. In July, August, September, and October, employment in Maine increases. Many of these jobs are seasonal and are occupied by young and inexperienced employees. Additionally, construction companies are very busy in the summer, generally peaking in September.

FIGURE 3. — PERCENT DEVIATION FROM MEAN, FIRST REPORTS AND EMPLOYMENT BY MONTH, MAINE, 1985

NOTE: Figures are adjusted for the number of workdays in the month.

The Nature of Injury or Illness classification identifies the principal physical characteristic; that is, what the actual injury or illness was. The pie charts below illustrate the percent of total for All and for Disabling natures.

Figure-4A. -- Nature of Injury or Illness All Cases, Maine, 1985

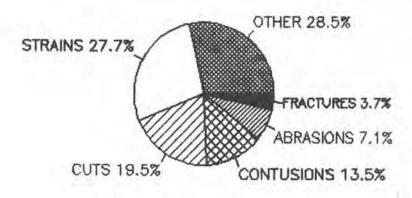

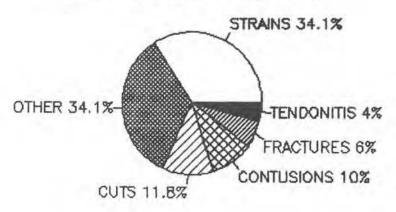

Figure - 4B. -- Nature of Injury or Illness Disabling Cases, Maine, 1985

NATURE OF ILLNESS

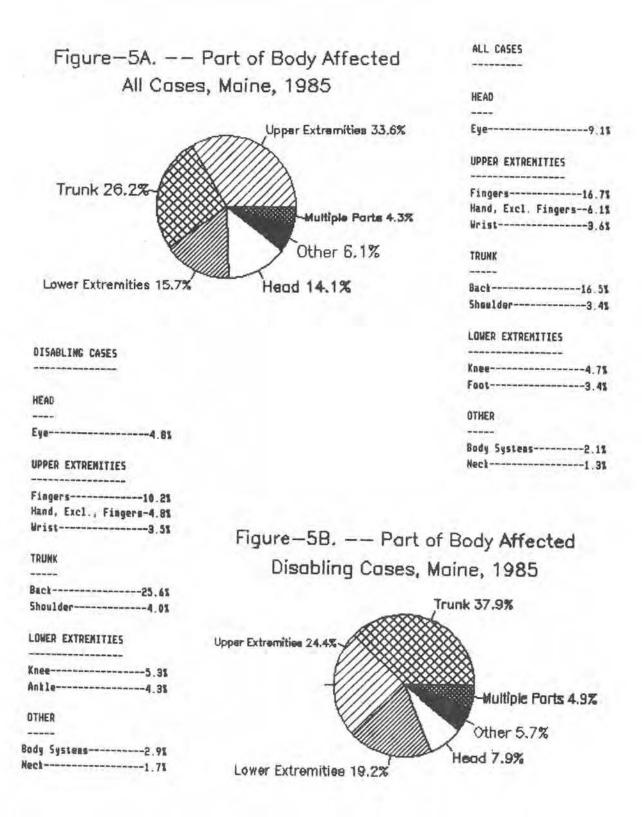

Occupational illnesses comprised only 8.1% of the total cases received in 1985. Inflammation of the joints and tendons, including tendonitis and bursitis, formed the majority of all illness cases reported. Such cases are usually the result of prolonged exertion of a specific area of the body (most often the upper extremities). Dermatitis, which includes rashes, is the second most frequent occupational illness. Systemic affects of toxic materials, often through inhalation, account for the next largest portion of occupational illnesses.

Part of Body Affected

This category identifies the part or body system of the injured or ill person's body that was directly affected by the injury or illness.

SOURCE OF INJURY OR ILLNESS

The Source classification identifies the object, substance, exposure, or bodily motion which directly produced or inflicted the injury or illness. Metal items, containers, and working surfaces were most often cited as sources of injury or illness for both All cases and Disabling cases.

TABLE 11. -- SOURCE OF INJURIES OR ILLNESSES, NUMBER & PERCENT

All Other	14,251	22.3	All Other	5.571	23.9

The Type of accident or exposure classification identifies the event or action which directly resulted in the injury or illness. The pie charts below illustrate the percent of total, by type, for All cases and for Disabling cases.

Figure-6A. -- Type of Accident or Exposure
All Cases, Maine, 1985

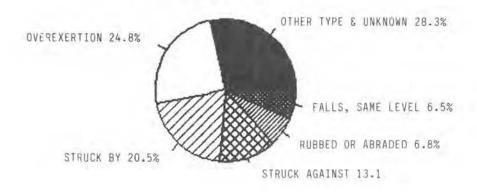

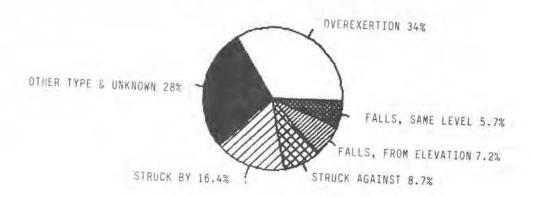

Figure-6B. — Type of Accident or Exposure Disabling Cases, Maine, 1985

The Associated Object or Substance(AOS) identifies the object, substance or person with respect to which measures could have been introduced to prevent the accident or mitigate the injury or illness. The relationship between the AOS and the Source may be directly or indirectly causal. In the instance of a worker who cut a finger by touching against a moving table saw blade, the Source and the AOS would be the same object — the saw, because no other object had a direct relationship to the injurious event. However, if a forklift ran into a worker, causing the worker to fall into the table saw, thus cutting the finger, the Source would still be the saw since it actually cut the finger but the AOS would now be the forklift because it initiated the accident sequence.

Containers, Unpowered Hand Tools, and Working Surfaces respectively were the most frequently cited AOS categories for All cases whereas Containers, Working Surfaces, and Vehicles were most frequently cited for Disabling cases.

TABLE 12. -- ASSOCIATED OBJECTS OR SUBSTANCES, NUMBER & PERCENT FOR ALL & DISABLING CASES, MAINE, 1985

NATURE-PART COMBINATIONS

Figures found in table 13 indicate which nature/part combinations for injuries in the workplace were the most prevailent in 1985. Strains to the back and cuts to the fingers far exceed any other combinations of injuries occurring that year.

TABLE 13. -- NATURE OF INJURY OR ILLNESS, BY PART OF BODY AFFECTED, PERCENT DISTRIBUTION, MAINE, 1985

					PART			
		********		1

^{1.} Except Fingers

NOTE: Ranking of the five most frequent combinations are shown in parenthesis.

^{2.} Except Back

NATURE-TYPE COMBINATIONS

We can use table 14 to elaborate on the information in table 13. For example, back sprains were the most frequent nature/part combination noted in table 13. From table 14 we can see that most strains were due to overexertion (lifting, pushing, handling, etc.).

Cuts to the fingers were the second most frequent combination noted in table 13. Table 14 reveals that most cuts were the result of striking against objects or being struck by objects. Most bruises occurred this way also.

TABLE 14. -- MATURE OF INJURY OR ILLNESS BY TYPE OF ACCIDENT OR EXPOSURE, PERCENT DISTRIBUTION, MAINE, 1985

		Symples		T	YPE		
NATURE	Yotal	Struck By or Against	Over- exertion	Fall	Rubbed or Abraded	Caught In, Under or Between	Other

Strains, Sprains	27.7	2.0	17.5(1)	2.7	0.2	0.6	4.7
Cuts, Lacerations	19.5	16.3(2)	0.1	0.6	0.5	0.8	1.2
Contusions, Bruises	13.5	8.0(3)	0.1	2.8(5)	0.1	2.0	0.5
Scratches, Abrasions	7.1	0.9	0.1	9.2	5.7(4)	0.1	0.1
Other	32.2	6.4	7.0	4.6	0.3	1.2	12.7

NOTE: Ranking of the five most frequent combinations are shown in parenthesis.

NATURE-SOURCE COMBINATIONS

As we follow in progression from table 13 onward, we can learn even more about the two most frequent nature/part combinations. From table 15, we can see that most strains involved containers as the source. Remember the largest type for strains was overexertion. Hence, we can conclude that many strains are the result of lifting, pushing or handling containers. Similarly, we can see that most lacerations involve the use of non-powered hand tools (e.g. knives, wrenches, and screwdrivers). Metal items are also a significant source of cuts. Hence, we can conclude that many cuts are due to being struck by or against knives, wrenches, and other hand tools or metal items.

TABLE 15. --NATURE OF INJURY OR ILLNESS BY SOURCE OF INJURY OR ILLNESS PERCENT DISTRIBUTION, MAINE, 1985

SOURCE Metal Boxes, Working Hand Tools NATURE Items Contain. Surfaces (Not Pwd.) NOTE: Rankings of the five most frequent Nature-Source combinations are shown in parenthesis.

SOURCE-TYPE COMBINATIONS

Falls to the working surface was the number one combination of Source/Type, occurring in 7.6% of All Cases. The second most frequent combination was overexertion due to lifting, pushing, or handling containers. Many claims were also filed as a result of being struck by unpowered hand tools or metal items.

TABLE 16. -- SOURCE OF INJURY OR ILLNESS BY TYPE OF ACCIDENT OR EXPOSURE PERCENT DISTRIBUTION, MAINE, 1985

		TYPE OF ACCIDENT OR EXPOSURE

Other	42.4	9.9	9.0	2.0	4.0	1.3	16.2			

NOTE: Rankings of the five most frequent Type-Source combinations are shown in parenthesis.

AOS-TYPE COMBINATIONS

Remember that the AOS is the object, substance, or person with respect to which measures could have been introduced to prevent the accident or mitigate the injury or illness. From table 17 we can see that use of unpowered hand tools resulted in many injuries as did the handling of containers. Working surfaces, in some instances wet or slippery, resulted in many accidents as well. Further, the use of machines, in some instances from items propelled from machines, was another notable AOS.

TABLE 17. -- ASSOCIATED OBJECT OR SUBSTANCE BY TYPE OF ACCIDENT OR EXPOSURE PERCENT DISTRIBUTION, MAINE, 1985

PART IV

CHARACTERISTICS OF FATALITIES

Table 18 is a nine-year summary of fatalities as reported to the Workers' Compensation Commission. Figures for 1984 include all reports in our files, but may not include all fatalities reported that year. Nearly 37% of all fatalities during this nine-year period were a result of heart attacks. The Workers' Compensation Commission determines whether such incidents are work-related.

In 1985, there were 45 reported fatalities. Fourty-seven percent of these deaths were attributed to heart attacks. All others were caused by injuries at work, with 4 resulting from auto accidents. For the first time in nine years, no deaths were attributed to illnesses other than heart attacks.

Over the past nine years an average of 81% of fatalities happened in the Private Sector, with 30% of all fatals happening in Manufacturing industries. In the Private Sector, the Construction and the Transportation and Utilities industries follow Manufacturing in the number of reported fatalities. In the Public Sector, public safety crews reported the highest number of work-related fatalities.

^{1.} Fatality figures for 1984 are incomplete.

No attempt will be made to compare year-to-year fatality figures by occupational classification because a new occupational classifying system was adopted in 1985. Of the 45 fatalities reported in 1985, the category entitled Precision Production, Craft and Repair Ocupations recorded a high of 8 fatalities. This category includes all mechanics and construction and trades workers.

TABLE 20. -- NUMBER & PERCENT OF INJURY & ILLNESS FATALITIES
BY OCCUPATION, MAINE, 1983

		ITAL	INJURIES		ILLNESSES	
CATEGORY	Number	Percent	Number	Percent	Number	Percent
				*****		*****
ALL WORKERS	45	100.01	55	100.0%	53	100.01
Executive, Administrative, Managerial	5	11.1	1	4.5	4	17.4
Professional Specialty	2	4.4	2	9.1	0	-
Technicians & Support	2	4.4	2	9.1	0	
Sales	1	2.2	1	4.5	0	-
Admistrative Support - Clerical	2	4.4	0	-	2	8.7

Protective Service Workers	2	4.4	0	-	2	8.7
Other Services	0	-	0	-	0	-
Farming, Fishing, Forestry	2	4.4	2	9.1	0	-
Precision Production, Craft and Repair	8	17.8	4	18.2	4	17.4
Machine Operators, Assemblers, Inspectors	3	6.7	0	-	3	19.0
Transportion and Material Movers	4	8.9	3	13.6	1	4.3
Handlers, Equipment Cleaners, Laborers	5	11.1	4	10.2	1	4.3
Unknown	9	20.0	3	13.6	6	26.1

As shown in table 21, nearly all deceased workers age 35 and under died as a result of an injury whereas most deceased workers age 46 and over died as a result of an illness. In the latter group of workers, heart attacks were a big factor.

In the age category 41-45, the number of fatalities is much lower than the number of fatalities for age categories surrounding this group. In 1985, there were no reported fatalities in this age group. Workers between the ages of 41 and 45 are likely to have a good deal of work experience and are often too young to be considered heart-attack candidates.

TABLE 21. -- FATAL INJURIES & ILLNESSES BY AGE GROUP MAINE, 1977-1985

	NINE-YEA	D TOTAL	TM.III	RIES	ILLNES	SES

56-60	48	13.5	15	6.8	33	24.6
61-65	55	6.2	10	4.5	12	9.0
66-70	9	2.5	4	1.8	5	3.7
71-75	5	1.4	3	1.4	2	1.5
Over 75	4	1.1	3	1.4	1	0.7

^{1.} Fatality figures for 1984 are incomplete.

NOTE: Age unknown not shown.

The link between injuries and illnesses and job experience becomes more visible when reviewing table 22. We see that those with less than 2 years of service with a company comprise nearly 50% of all fatalities due to injuries. Those with over 15 years of service with a company account for 36.5% of all fatalities resulting from an illness, including heart attacks. Hence, injury is tied to inexperience while illness is linked to exposure and advancing age.

TABLE 22. -- NUMBER OF FATAL INJURIES & ILLMESSES, BY LEMGTH OF SERVICE, MAINE, 1977-1985

	NINE-YEAR TOTAL	INJURIES	ILLNESSES

# APPENDIX A TECHNICAL NOTES

Under the Maine Workers' Compensation Act and the Occupational Disease Law, employers must file a First Report of Occupational Injury or Occupational Illness or its equivalent within seven days of notice or knowledge of each incident which resulted in the loss of at least one day's work or which required the services of a physician. Also, a significant number of voluntary reports are filed that do not meet these conditions, but are submitted to protect the rights of both parties in case of later complications. As the reports are received, they are assigned a number which serves as a unique identifier of that particular case. The First Reports are then coded by the staff of the Research & Statistics Division, Bureau of Labor Standards for the data elements shown below:

DATA ELEMENT	SOURCE	DEFINITION
Case Number	Maine Workers' Compensation Commission	Unique number assigned sequentially by the W.C.C.
Employer Number	Bureau of Employ- ment Security	Unemployment Insurance number assigned by B.E.S.
Industry/Ownership	U.S. Office of Management & Budget, Standard Industrial Class- ification Manual	In most cases, the SIC assigned by B.E.S. is used. In cases where the employer is not covered by Unemployment Insurance, an SIC is assigned by the R & S Division based on the information on the First Report. An ownership code is also assigned to show whether the employer is in private industry, state government, or local government.
County	State Planning Office, Geo- graphic Coding System	Code is assigned based on the county in which the incident occurred.
Insurance Carrier	National Council of Compensation Insurance	The N.C.C.I. number of the employer's insurance carrier is assigned.
Sex	- ==	From First Report
Age	-	From First Report
Date	-	The date of occurrence is used if applicable. For illnesses, the date of diagnosis is used.

Time of Accident	v i	Time listed is converted to the 4-digit, 24 hour system. (Optional)
Length of Service	( <del></del> )	Month coded if less than one year's service. Years used otherwise. All fractions rounded downward.(Optional)
Occupation	1980 U.S. Bureau of Census Occup- ational Classif- ication System	Codes assigned based on occupation listed or determined from the First Report, coded to the 3-digit level.
Nature of Injury or Illness		ANSI Z16.2 as modified is used. All coding is done to the 3-digit level. Identifies the most serious injury or illness in terms of its principal characteristics.
Part of Body Affected	As Above	Coding is done to the 3-digit level. Indicates part of body or the body system associated with the nature of injury or illness.
Source of Injury or Illness	As Above	Coding is done to the 4-digit level. Identifies the object, substance, or motion which directly produced or inflicted the previously identified injury or illness.
Type of Accident or Exposure	As Above	Coding is done to the 3-digit level. Identifies the event which directly led to the injury or illness.
Associated Object or Substance(AOS)	Developed by the Bureau of Labor Statistics, U.S. Dept. of Labor	Using a coding list similar to that for Source, AOS identifies the object, substance, person, or bodily motion with respect to which measures could have been taken to prevent the accident or exposure or mitigate the injury or illness.
Severity		Four levels of severity are coded: 1) Fatal 2) Disabling (one or more lost workdays beyond the date of injury). 3) Nondisabling (no lost worktime beyond the date of injury). 4) Unknown (not reported)

#### APPENDIX B

#### DETAIL TABLES

Data from a series of detail tables produced for the Research & Statistics Division, Bureau of Labor Standards, Department of Labor, by the U.S. Bureau of Labor Statistics is available to the public. A complete list of these tables appears on the following pages. Copies are available upon written request to the Bureau Director, Bureau of Labor Standards, State House Station #45, Augusta, Maine 04333. Please specify table number and title.

# SPECIAL STUDIES

The Research & Statistics Division of the Bureau of Labor Standards has the ability to produce special tabulations and studies of the data elements listed in Appendix A. Requests for special studies should be made in writing to the Bureau Director at the above address. The ability to fill such requests is limited by the availability of computer and staff resources. In addition, there may be charges for reimbursement of costs.

# WORK INJURY REPORT (WIR) SURVEYS

The Office of Occupational Safety and Health Statistics of the Bureau of Labor Statistics has conducted several surveys focusing on specific characteristics of accidents. Each survey was conducted in a number of SDS-participating states. The survey respondents were the injured workers who were chosen from First Reports according to survey criteria. No names(firm or injured worker) were disclosed and responses were voluntary.

The responses to these surveys were tablulated and summarized in WIR publications. A list of publications available appears below. Requests for this data may be made in writing to the Bureau Director at the above address. Supplies of these are somewhat limited.

# APPENDIX D - MAINE'S ON-SITE JOB SAFETY & HEALTH CONSULTATION PROGRAM

- provides you with a cost-free safety and health inspection without penalty provisions and a confidential written report.
- . . . provides a pre-construction review of plans or specifications for potential safety and health problems.
- provides you with equipment and laboratory assistance to measure potential safety and health problems.
- provides safety and health alternative correction action to assist in complying with OSHA citations.
- provides safety and health inspections of only those areas in your establishment specified by you.

The Maine job safety and health consultation program began in 1978 to help employers, primarily small employers, maintain a safe workplace by understanding and complying with OSHA regulations. This is a cost-free and penalty-free program conducted under a contract between the Maine and the U.S. Departments of Labor.

The consultant will first meet with you to explain the procedures and to update you on OSHA activities. Then, the consultant will inspect your workplace and will note any violations of rules and potential hazards. You are encouraged, but not required, to have worker representatives participate.

When the inspection is completed, the consultant will review the findings with you, including how the standards apply to the workplace, which OSHA rules you may be vioalting, and ways to correct the deficiencies. The consultant also can help you interpret the standards and inform you of other available resources, or to aid you in correcting safety and health problems.

Later, you will receive a written technical report covering the information given you during the visit, including the specific rules which apply and ways to correct violations.

If you would like more information on this program or would like to request a consultation, call the Bureau of Labor Standard's Safety Division at 289-2591 or write to them at Station 45, Augusta, ME 04333.

### APPENDIX E -COMMENTS FORM

Your comments about this material will help us to improve our publications. We are interested in any feedback concerning its usefulness, accuracy, organization, and completeness. Requests for additional copies will be filled subject to availability. (See Appendix F). Requests for further details on this subject should be sent to the Bureau Director at the address below. These requests may be denied due to confidentiality restrictions.
