Re: Phase II Technical Report of the East-West Highway Economic Impact Analysis

I am forwarding, for your reading pleasure, the Phase II Technical Report of the East-West Highway Economic Impact Analysis. This report contains the results of both the business and the tourism surveys as well as updated commodity flow information and the commodity forecast. You should have received the Phase I report, detailing the baseline and projected economic and demographic conditions, in mid-July. The Phase III and IV reports will be delivered to you over the next 4 weeks. Phase III will provide the economic impact analyses along the various corridors and the sensitivity analyses. The Phase IV report will contain estimated real estate impacts and the results of our Case Studies (analogous routes). Our final report on the economic impact of the proposed highway, along with DOT's analysis and findings, will be delivered to the Legislature and the Governor on September 15th.

As I mentioned in my first transmittal letter, because of the comprehensive nature and sheer density of our work, we decided to release our findings in a series of smaller technical reports. **These first four reports are purely technical in nature, providing information that is critical to the foundation of our analysis. Policy implications are not drawn in this report, nor will they be drawn in the technical reports that follow. They are meant to provide the essential information necessary to formulate and evaluate policy options.** That said, I would encourage and welcome your feedback on what you see as the most important implications from the 4 technical reports. To the fullest extent possible, we will supplement our findings with your ideas in developing the final report.

In an effort to reduce printing costs and to increase accessibility to this information, each report will be placed on the State's website (www.state.me.us) as it becomes available. Please feel free to encourage others to examine our work and provide me with any feedback they may have. To the extent that we can inform and increase the dialogue on this proposal, we will all benefit with a richer analysis of the full range of policy options available to us.

ENCLOSURE

OFFICES LOCATED AT: 184 STATE STREET
Internet: www.state.me.us/spo

PHONE: (207) 287-3261

FAX: (207) 287-0383

Thank you all for your patience and for your feedback. If you have any questions, please feel free to call me at 287-1479 or e-mail me at laurie.lachance@state.me.us . I will try to direct you to the most appropriate resource.

I

Introduction

Overview

The primary purpose of this report is to present and summarize the findings of business and tourism survey research which was undertaken for the economic impact analysis of the proposed Maine East-West Highway. In addition, the report presents the findings of a 1997-2015 forecast of commodity flows to and from Maine and to/from Atlantic Canada.

The survey findings and commodity flow projections are both important indicators of potential growth in travel demand to and through the State of Maine. The broad objectives of survey research were to:

- a. Develop a baseline of information concerning current business (freight) and tourism traffic to/from Maine and those surrounding regions that would become more accessible to the State if an east-west highway were built;
- b. Gain insights into how businesses and potential visitors might respond to potential improvements to east-west transportation routes through Maine;
- c. Obtain information that can be used to help refine quantitative projections of business (truck) traffic and tourism travel growth associated with each of the proposed East-West Highway corridors; and
- d. Determine whether businesses and potential tourists exhibit any "preferences" in terms of the five conceptual corridors evaluated in this report.

In addition to the above objectives, the business survey solicited information and opinion on a variety of issues related to US Canada Trade. These questions addressed perceived current and future trade opportunities and impediments, the potential contribution of an East-West Highway toward increasing trading relationships with Canadian businesses, and the possible effects of tolling the highway.

The commodity flow forecasts provide an additional source of insight into current and future regional trading relationships and freight movements to, through and around Maine. Baseline (1997) estimates of Maine and Atlantic Canada commodity (tonnage) flows by origin/destination, commodity type and mode of transportation were previously reported in the Phase I Technical Report. These baseline estimates have since been updated and refined, and are used in this report to forecast the potential growth in freight movements from 1997 to 2015.

These forecasts are an indicator of the potential future volume of freight that will need to be transported by truck, rail and ship, by the time an east-west highway could actually be placed in service. Forecasted percentage changes in total tonnages of commodities

moved to, from and through Maine and Atlantic Canada are an obvious indicator of future growth in shipments or trips which will be required to transport those goods. The commodity flow forecasts are one of several inputs to a statewide traffic model that is being used to forecast future truck traffic for the various conceptual east-west highway corridors.

East-West Highway Corridors

The Phase I Technical Report discussed the process that was used to select five conceptual highway corridors on which to base the economic impact analysis. Because the corridors are referenced in the survey research, a map and descriptions of the corridors are provided for reference. These corridors include three upgrade alternatives and two corridors on new alignments, as shown on Map I-1 and described below¹:

Corridor Upgrade Alternatives

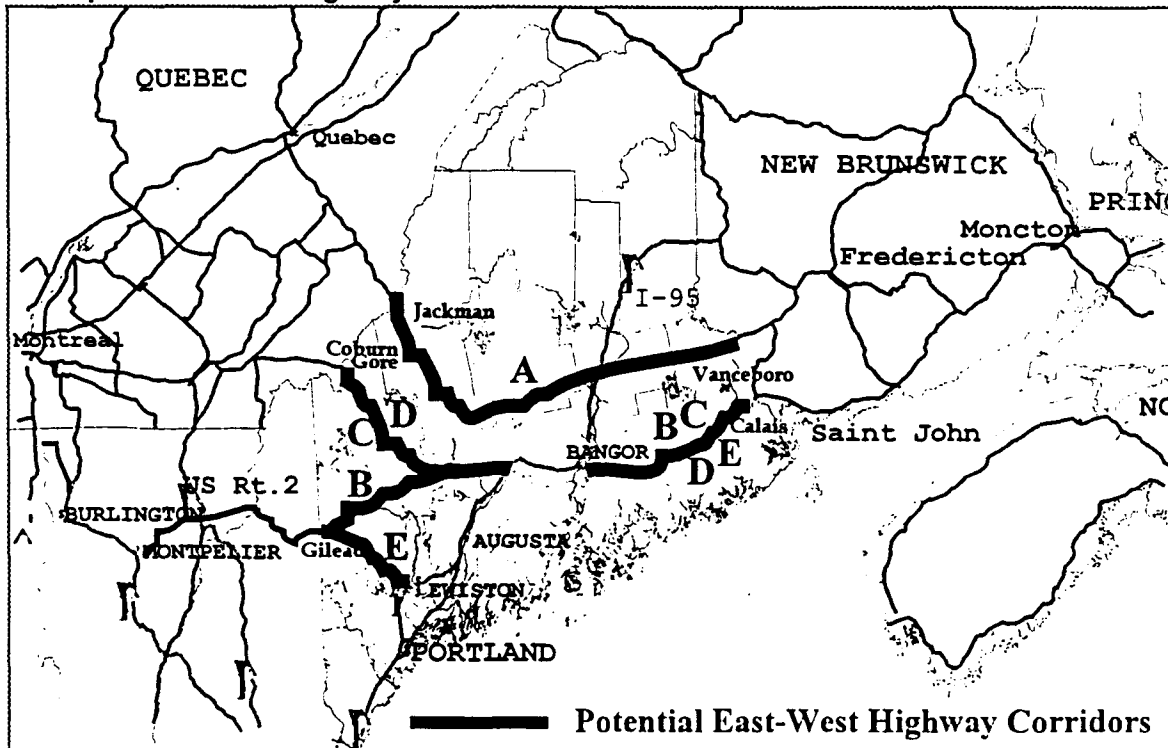

Corridor "A": *The Trans-Maine Trail (Alternate)* This corridor begins at the Canadian border in Vanceboro and proceeds westerly via Route 6 through Lincoln, Milo, Dover-Foxcroft, and Guilford to Abbot, then westerly via Route 16 to Bingham. The trail proceeds northerly along Route 201 to Jackman and Sandy Bay at the Canadian Border. (Includes Routes 6, 16 and 201)

Corridor "B": *The East-West Highway* As defined in statute, this corridor begins at the Maine/New Brunswick border and proceeds westward along route 9 to Route 46 in East Eddington. The corridor continues southerly along Route 46 to Route 1A in East Holden, then westerly along Route 1A to I-395 in Brewer and connects with I-95 at or near Bangor. It then continues southwesterly along existing I-95, leaving I-95 in Newport. From this point, it continues westerly along Route 2 to the Maine/New Hampshire border at Gilead. (Includes Routes 9, 46 1A, I-395, I-95, & 2)

Corridor "C": *The East-West Highway (Alternate)* Beginning at the Maine/New Brunswick border, this corridor proceeds westward along Route 9 to Route 46 in East Eddington. The corridor continues southerly along Route 46 to route 1A in East Holden, then westerly along Route 1A to I-395 in Brewer and connects with I-95 at or near Bangor. It then continues southwesterly along existing I-95, leaving I-95 in Newport. From this point, it continues westerly along Route 2 to Route 27 in Farmington, then continues northwesterly along Route 27 to the Maine/Quebec border at Coburn Gore, linking Sherbrooke and Montreal via Quebec Route 10. (Includes Routes 9, 46, 1A, I-395, I-95, 2 & 27)

¹ Corridor definitions were provided by the Maine Department of Transportation.

Map I-1
Conceptual East-West Highway Corridors

Corridors on New Alignments

Corridor "D": This corridor is a limited access 4-lane highway, predominately on new alignment, beginning at the Maine/New Brunswick border, at a location somewhere in the vicinity of Calais/Baileyville and connecting to Saint John Fredericton, and Moncton via NB Routes 1, 2 and 3. The corridor then proceeds westward along or south of Route 9, connecting with I-395 and I-95 at or near Bangor, and continues southwesterly along existing I-95, leaving I-95 at a point between Newport and Augusta. From this point, it continues northwesterly to the Maine/Quebec border at or near Coburn Gore, linking Sherbrooke and Montreal via Quebec Route 10.

Corridor "E": Also a limited access 4-lane highway, predominately on new alignment, this corridor begins at the Maine/New Brunswick border at a location somewhere in the vicinity of Calais/Baileyville and connecting to Saint John Fredericton and Moncton via NB Routes 1, 2 and 3. The corridor then proceeds westward along or south of Route 9, connecting with I-395 and I-95 at or near Bangor, and continues southerly along existing I-95/I-495, leaving I-95/I-495 at a point between Augusta and Gray. It then continues in a generally northwesterly direction to the Route 2 corridor crossing into New Hampshire at or near Gilead, linking New Hampshire, Vermont, and Montreal via Route 2 and I-89.

The collection and presentation of information in this report are intended to support the development of policy simulations for the economic impact forecasts. This progress

take more trips to Maine:

- ▶ 67% had indicated earlier in the survey that they did not plan to travel to Maine in 1999, and
 - ▶ 82% had not traveled to Maine in 1997 or 1998.
- Reducing long travel times is apparently appealing to those who have not recently visited Maine, intriguing them to say they'll do so. Due to the fact that much of the increase in visits would occur among those who do not have recent experience traveling to the state, it may be difficult to predict where their destinations would be or if their response might change should a specific corridor be defined.

1997 & 1998 Trips THROUGH Maine

- Key market residents took an average of 0.13 trips (per household) through Maine on their way to other states or provinces in 1997 and 1998.
- The average yields an estimated 322,647 trips through Maine.
 - ▶ 51% of those trips were taken in 1997, and
 - ▶ 49% were taken in 1998.
- The average number of people on these trips through Maine was 2.79.
- The average number of nights spent in Maine during these trips was 1.27.
- The primary destinations on these trips through Maine were:
 - ▶ Nova Scotia,
 - ▶ Florida, and
 - ▶ New York.
- 61% of the primary destinations were in the United States, and 39% were in Canada.
- Among Canadian visitors making trips through Maine on their way to other locations,
 - ▶ 76% were traveling to destinations in the United States, and
 - ▶ 24% were traveling to destinations in Canada.
- An estimated 876,183 person-nights were spent in Maine in 1997 and 1998 on these trips through Maine.

Estimated Impact of an East-West Highway on Tourism Travel

- Survey respondents indicate that the proposed highway improvements will be an incentive for a sizable proportion of people to travel to Maine more often. It is important to note that the survey found significant levels of recent travel to and through Maine, even from markets as far west as Toronto. A significant percentage of these respondents, about 15%, indicated that their travel patterns to or through Maine could be influenced by an improved east-west transportation route within the

state. Among some respondents, even very modest time savings, relative to the total trip length required to reach and return from Maine, would be sufficient to induce them to make more trips to or through the state. These results are encouraging and suggest that an east west highway would generate an increase in tourism travel to Maine.

- The combined effects of travel time savings on potential trips to and through Maine, along with the associated number of person-nights spent in the state, are summarized in Table 1-2. These estimates reflect the combined impacts of reduced travel times and improved highway access to/through Maine on all of the market areas surveyed. If travel time savings indicated in the survey instruments could be simultaneously provided to all of the market areas surveyed, the collective impact produces an increase of roughly 1.3 million trips 6.1 million visitor days.

Table 1-2: Respondents' Reactions to Potential Time Savings Associated with Conceptual East-West Highway Corridors

<i>Impact on Travel <u>to</u> Maine</i>	
Increase in Trips to Maine	346,267
Increase in Person-Nights Spent in Maine	2,968,387
<i>Impact on Travel <u>through</u> Maine</i>	
Increase in Trips through Maine	953,610
Increase in Person-Nights Spent in Maine	3,191,695
<i>Total Potential Impacts on to- and through-travel</i>	
Number of Trips	1,299,877
Number of Person-Nights Spent in Maine	6,160,082

- It should be noted that when surveying each target market, the potential time savings presented to survey respondents reflected the maximum savings associated with the conceptual corridor which best served that particular region. No single east-west corridor is capable of providing comparable time savings to all of the markets sampled by the survey. Therefore, applying these survey results to project actual annual visitation to Maine, to any single conceptual east-west highway corridor, must be approached very cautiously. In addition, respondents were only asked to anticipate their travel plans over the next year; projecting these figures to continual travel over a longer period of time is difficult. Also, respondents were not presented with specific highway corridors; rather, they were given one single time saving to one particular destination. Respondents may have mistakenly assumed that this same time savings would apply to all of their normal destinations in Maine. Finally, it is not uncommon to discount respondents' stated intentions by large percentages in order to arrive at the actual actions they may undertake. All of these factors need to be considered when converting the survey findings to actual projections of market response to each individual proposed east-west highway corridor.

Business Survey Research

The business survey effort returned data from a significant sample of Maine's largest companies. The survey returned an equal number of responses from both northern and southern regions of the state and included representation among several industry groups. Highlights include the following:

- ▶ **The survey effort specifically targeted companies that would be most likely to have an interest in the proposed east-west highway.** The survey was administered to a cross-section of the State's largest companies, in those industries which are most sensitive to transportation issues. In total, just over 40% of the sample, more than 500 companies, were located in northern Maine while the balance of nearly 800 firms were located in the more heavily populated southern region.
- ▶ **A well-represented cross section of responses was received, both geographically and among industry groups.** More than 150 responses were received, an 11.5% return on from the initial mailing list. Returns were equally distributed between the northern and southern regions, with 76 returns received from each. In total, these companies have more than 19,600 full-time employees, including more than 16,300 workers at the locations represented in the survey.
- ▶ **Survey respondent already have significant numbers of customers and suppliers in regions that could be made more accessible by an east-west highway.** More than 49% of respondents, statewide, have customers and/or suppliers in Atlantic Canada, 47% in Quebec, 26% in Ontario/Western Canada, 55% in northern NH/VT, 56% in Western NY and 60% in the Midwest and Western US. These percentages indicate that at least half of the statewide sample currently does business in regions that could be made more accessible to the interior Maine, via an east-west highway corridor.
- ▶ **More Maine firms characterize their markets to the south and west as "growing" than Canadian markets.** For respondents with Atlantic Canada customers, less than 38% characterized recent sales trends as "growing", while higher percentages of respondents characterized their sales to Quebec (45%) and Ontario (58%) as growing. By comparison, more than 70% of firms with customers in Southern NE, the Middle-Atlantic and Midwest US have recently experienced growing sales to those regions. Among Maine companies with Canadian customers, the fact that more describe sales as "declining or flat" than growing, is perhaps a reflection of recent unfavorable exchange rates, as was indicated elsewhere in the survey.
- ▶ **Roughly a third of all respondents appear to view Canada as a potential growth market in the future.** Maine firms are primarily looking to other US regions for sales growth. In the short term, higher percentages of respondents expect to increase sales within Maine, to Southern New England and the Mid-Atlantic States, the Midwestern US, and Northern NH/VT, than to Canadian markets. Also, the percentage of Maine firms that are unlikely to do more business in Canada, is much larger than the percentage of firms that expect to increase Canadian sales. There is very little difference in expectations between southern and northern Maine companies on this issue.

- ▶ The survey findings suggest that improved westbound highway access may be more important for freight traffic originating in Maine than eastbound access. Numbers of outbound truck shipments westbound to Ontario and Quebec, exceed eastbound shipments to Atlantic Canada by a factor of 2.3 to 1. Westbound shipments to Upstate NY, the Midwest and Western US also exceed the volumes headed for Ontario and Quebec. It is also interesting to note that total monthly shipments leaving northern Maine greatly exceed southern Maine.
- ▶ Rail does not currently carry significant volumes of outbound freight to those regions that would be serviced by an east-west highway. Respondents ship virtually no product to Canada and limited volumes westbound to US destinations, by rail.
- ▶ Although a minority of Maine firms appear to encounter problems when shipping or receiving goods to/from the regions listed in the survey, problems are significantly greater in those areas which could be improved by an east-west highway. The largest percentage of firms (more than 25%) reported encountering very frequent or frequent problems, when sending or receiving shipments to/from other locations within Central and Northern Maine. The percentage of Maine companies that encounter transportation problems when shipping to/from Atlantic Canada (21%) or Quebec (22%), is also higher than the other regions listed. The smallest percentage of companies report encountering transportation problems, when shipping/receiving freight to or from Southern New England and points south (6.3%) and Upstate New York (9.5%).
- ▶ No single east-west corridor clearly emerges as a preferred alternative among survey respondents. When respondents were asked to rank each conceptual corridor on the basis of its likely level of use by that company and its suppliers, the reported average for the entire statewide sample did not exceed 3 (the mid-point) for any corridor. Even Northern Maine respondents, composite scores for all Corridors were also below 3. The percentage of respondents ranking each Conceptual Corridor a "1" (low use), exceeded those indicating "5" (high use) in each case, even when responses were isolated for northern and southern Maine.
- ▶ As could be expected there are regional differences in projected levels of use and "preference" among the five Corridors. Among Northern Maine firms, the 4-lane Calais to Coburn Gore Corridor (D) ranked highest, by a slight margin over the Route 2 and Route 9 upgrade (Corridor B) from Calais to Gilead. Southern Maine firms indicated that they would be most likely to use the four-lane Corridor (E) linking Lewiston-Auburn to the NH Border at Gilead. It is also interesting to note that the incremental improvement of the Calais to Coburn Gore route from a 2-lane upgrade (Corridor C) to a four-lane highway (Corridor D), did not produce a large increase in the anticipated use of that route, among either statewide or Northern Maine respondents. When asked to rank the Corridors, with 1 signifying first preference, among all respondents statewide, Corridors C & D ranked first with the same score, followed by B, E and A. Among respondents located in Northern Maine, the order was similar, with Corridor A moving from 5 to 3. Southern Maine firms, ranked Corridors E and B one and two.
- ▶ When presented with a list of possible economic benefits that might arise from the construction of their "preferred" east-west highway corridor, about 20% to 40% of the respondents actually expected their companies to benefit. Nearly 39%

of respondents statewide believe that their preferred corridor would be “highly likely” or “likely” to lower their firms’ shipping costs within Maine, compared to a slightly smaller portion of the sample (35%) who did not expect a lowering of shipping costs. When asked if the highway would increase the firms’ cost competitiveness, these percentages were reversed. A smaller percentage of companies (25%) believe that their preferred corridors would help them do more business with Canada, and fewer still (21%) believed that their preferred routes would facilitate commuting for employees. Because of the geographic dispersion of survey respondents, the maximum percentage of firms that are likely to derive economic benefits from any single Conceptual Corridor reduces these reported ratios by more than half.

- ▶ **An east-west highway is not likely to cause a significant movement of firms within the State.** Just under 23% of respondents, indicated that they would be “highly likely” or “likely” to expand operations at their existing facilities if their “preferred” east west corridor was built. The potential of a new highway to induce movement of existing firms around the state appears to be minimal, as less than 2% indicated that they might move closer to a new highway. About 12% thought that they might expand at another location within the state, 6.2% might expand in Canada and less than 3% might expand elsewhere in the US.
- ▶ **From the current perspective of Maine businesses who responded to this survey, the State’s failure to improve east-west transportation routes would not appear to have a negative influence on future expansion decisions.** More than 24% of respondents indicated that they will be “highly likely or likely” to expand at their current locations, absent of the highway’s construction. This percentage was slightly higher than the response to the preceding question, which assumed the existence of a new highway. A slightly smaller percentage of firms indicated that they would be likely to expand elsewhere in Maine if no highway improvements were made, fewer firms indicated that they would be likely to expand in Canada, absent of an east-west highway, but more may decide to expand elsewhere in the US.
- ▶ **Survey respondents are split concerning where an east-west highway should rank as a priority among other transportation needs over the next 20 years.** Statewide, a minority of respondents with an opinion on the issue, ranked the east-west highway as either a “highest” or high” priority over the next 20 years, with the 4-lane Corridors (35%) ranking lower among respondents than a 2-lane improvement (43.2%). Significant numbers also ranked either option as either “low or not a priority”, 31.5% for the 2-lane and 43.5% for the 4-lane corridors. Among Northern Maine businesses, a majority (52.5%) rank the two-lane Corridors as either a highest or high priority, compared to only 24.6% who hold the opposite view. It is interesting to note that the four-lane Corridors rank lower than the two-lane even among northern Maine firms, with only 39.7% characterizing them as a highest or high priority, compared to 41% who characterized them as a low priority or not a priority.
- ▶ **Among impediments to increased Canada trade faced by Maine companies, transportation issues rank lower than economic and regulatory issues.** Respondents were asked to rate ten listed impediments to increased Canadian trade in order of importance from 1 (none) to 5 (high). Among those, regulations/red tape ranked highest (3.46), followed by exchange rates (3.44) and competition from other US & Canadian firms (3.30). Among other factors that ranked above 3.0, “shipping

costs" ranked 4th (3.24) followed by Canadian economic conditions (3.19), and border crossing/Canadian Customs (3.09). The quality of "highway access" to Canada scored 3.04, 7th among the ten issues listed.

- ▶ **Respondents would accept limited tolling of an east-west highway.** Among persons with opinions, more than half indicated that toll rates of less than 10¢ per mile would not negatively influence their usage of the highway. However, substantial resistance to tolls is indicated at higher rates among those persons with an opinion. At an average toll rate of 16¢-20¢ per mile, the combined percentage of respondents with opinions who would be "very likely" to reduce travel or "would not use" the highway, rises to nearly 64%. At average toll rates above 20¢ per mile, the majority of respondents with opinions would not use the highway.

II

Commodity Flow Forecasts

Introduction and Methodology

The purpose of this section is to forecast and describe the projected flow of commodities into and out of the State of Maine and the Atlantic Provinces through the year 2015. During Phase I of this study, estimates of commodity movements by mode, commodity type and major regional origins and destinations, were developed for calendar year 1997. In the following section, similar forecast information is presented for the years 2000 and five-year increments to 2015.

All values discussed in this section are measured in tons rather than dollars, in order to provide a basis for converting the data to vehicle (truck) trips. The forecasts address the types of commodities moved through these regions, the origins and destinations of shipments and the modes of transportation used to move various types of commodities. Data presented for the State of Maine includes commodity flows to and from other US markets, in addition to imports and exports to/from Canadian markets. Similar information is also provided for the Atlantic Provinces.

The methodology used to generate the commodity flow estimates is described in the following paragraphs.

Commodity Compass Freight Database

Standard & Poor's DRI has developed a comprehensive forecast database of freight flows, with identification of origins, destinations, commodities, and primary shipment mode. The database covers all counties of the United States, and also includes overland trade between U.S. counties and Canadian provinces and Mexican states. Commodities are specified to the four-digit Standard Transportation Commodity Code (STCC) level. Modes are distinguished as air, inland water, rail carload, rail intermodal, private truck, truckload, and less than truckload. Annual forecasts of tons and ton-miles have been developed in the data base through 2020. Information for this analysis was developed to 2015 and is reported in this section.

The database was designed to support flexible, diverse, and varied custom aggregations. The forecasts presented and discussed in this book were developed through geographic, commodity, and modal aggregation of the more detailed forecasts in the Commodity Compass Freight Database. Consequently, the following discussion of the methodology supporting the Freight Database provides an understanding of how the forecasts in this book were constructed.

Forecast Process

Forecast development began by identifying historical patterns of freight flows by origin, destination, commodity, and mode. These flows were then attributed to production and demand by commodity and county, and to imports and exports for counties with ports.

From the perspective of domestic transportation, the volume of freight originating in a county is the sum of what is produced in the county plus what enters the United States through the county's ports. Similarly, the total domestic freight terminating in a county includes both what is used there and what goes there to leave the nation through the county's ports.

Crucial resources supporting the historical picture included production and demand data from DRI's Regional Economic Service, international shipping volumes for DRI's World Sea Trade Service, domestic freight volumes from Reebie Associates' Transearch database, and import and export volumes from the Port Import/Export Reporting Service (PIERS).

Central to the forecast process is a set of mode- and commodity-specific gravity models. These gravity models mathematically formalized the historical patterns among the geographies of freight origination (production plus imports), termination (domestic demand plus exports), and commodity movement. A separate gravity model was developed for each commodity/mode combination. A fundamental premise of the gravity model is that, other things being equal, demands for a commodity are more likely to be served by nearby rather than distant sources.

Forecasts of future originations and attractions by county were driven by sectoral forecasts from DRI's Regional Economic Service and by international trade forecasts from DRI's World Sea Trade Service. Embedded in these forecasts are evolutions in the geographic patterns of freight origination and termination. Annual freight flow forecasts were achieved by applying the gravity models to link patterns of origination with patterns of termination.

Data Limitations

While the database provides extensive modal and commodity coverage, there are omissions. These gaps appear in the historical portrait and are perpetuated in the forecasts. The omissions are primarily in commodities for which the missing modes account for small shares of total tons and smaller shares of ton-miles. While we believe the omissions are of minimal importance to the broad picture of freight flows, there will inevitably be potential applications in which they are burdensome.

Most of the omissions arise in the truck modes. We have neither private truck nor truckload data for commodities with the following two-digit STCC codes:

- 08 Forest Products
- 09 Fresh Fish or Marine Products
- 10 Metallic Ores
- 11 Coal
- 13 Crude Petroleum or Natural Gas
- 14 Nonmetallic Minerals
- 19 Ordnance or Accessories
- 40 Waste or Scrap Materials
- 41 Miscellaneous Freight Shipments
- 42 Shipping Containers
- 43 Mail or Contract Traffic

- 44 Freight Forwarder Traffic
- 45 Shipper Association Traffic
- 46 Miscellaneous Mixed Shipments
- 47 Small Packaged Freight Shipments

Another omission is the absence of pipeline data. The significance of this is somewhat different, in that pipeline is a very significant mode for some of few commodities moving by it. Excluding pipeline means that our coverage of those commodities, specifically natural gas, is severely restricted.

The above omissions are primarily in commodities for which the missing modes account for small shares of total tons and smaller shares of ton-miles. While we believe the omissions are of minimal importance to the broad picture of freight flows, there will inevitably be potential applications in which they are burdensome. For example, some of the above two-digit STCCs, particularly STCCs 08 and 09, are obviously important to Maine. According to the Census of Transportation, 1992 Truck Use Survey, "logs and other forest products" and "farm products" were both among the top ten Maine commodities shipped by truck, accounting for 6% and 10% of total truck movements, respectively.

Therefore, the reader should note that the following tonnage estimates of commodity movements by truck may be modestly understated by the omissions of the above commodity groups. However, these omissions will not result in similarly understated estimates of truck trips and resulting truck traffic forecasts for the east-west highway. The truck traffic estimates/projections developed by MDOT capture all truck movements, including those which may be omitted in this analysis.

A second class of limitation arises out of our treatment of modal split. Modal choice is not treated as sensitive to price or service characteristics of individual modes. Modal shares evolve over time in response to relative growth or contractions of commodities for which individual modes have advantages. For example, if the commodities in which rail intermodal has a large share grow more quickly than do other commodities, the total rail intermodal share will grow in the forecasts.

Finally, the reader may note that there are differences between the 1997 freight flows tonnages reported in the Phase I Technical Report, which were developed in December of last year, and the 1997 values shown here. The values contained in this report are more accurate and replace those reported previously. Reasons for the discrepancies are explained below.

For flows between Maine and other parts of the United States these differences are modest. They result from a methodological refinement to the way the numbers were constructed. In both cases, the 1997 values were constructed as forecasts from 1995 measures of county to county freight flows. The 1997 values as initially delivered were constructed using national level data on growth rates by industry. The values reported here utilize county level growth rate data. The latter properly captures geographic variation in industry performance.

The 1997 flows to and from Atlantic Canada as reported here are markedly different from those reported previously. This is also due to a major refinement in the methodology. The earlier data were developed directly from truck and rail shipment

surveys collected by Stats Canada. The current data use a methodology akin to that underlying the reported US to US flows. The approach incorporates 1995 data on flows between US counties to Canadian provinces, county and provincial growth rates by industry, and 1997 totals of transborder goods movement by industry. The current numbers, while much higher than were the earlier ones, are consistent with measures of total north and south transborder tonnage.

With these limitations in mind, commodity forecast results are reported below.

Overview

Maine

In 1997, 14.3 million tons of cargo left the state of Maine for other US states by rail, truck, or water. Tonnage leaving the state travels primarily by truck, which accounted for 79% of outbound tonnage in 1997. Rail accounted for 17% while shipments by water accounted for only 4% of total outbound tonnage in 1997. Total tonnage is forecast to grow at a 2.5% average annual rate through 2015, with modal shares unchanged.

Table 2-1: Maine Outbound-Inbound Freight Forecast Summary (Tonnage)

						Change: 1997-2015		
	1997	2000	2005	2010	2015	Total 1997-15	Annual Average	Ann % Change
Maine to US Outbound								
Water	599,087	645,686	700,495	747,488	844,898	245,811	13,656	1.8%

Inbound tonnage to Maine from the rest of the United States totaled 8.6 million tons in 1997. Trucks are the most popular mode of transportation to move cargo into the state, with 46% of total tonnage entering the state by truck. Much more tonnage enters the state via water transport than leaves the state by the same mode; 34% of 1997 tonnage entered Maine by boat. Much of the water tonnage is in petroleum products from the Mid-Atlantic States. Rail accounted for 20% of tonnage entering the state in 1997. Over the forecast horizon, total inbound is expected to grow at an average annual 2.0%, with trucks steadily gaining share. Rail share will hold steady though 2010 and then rise somewhat.

Also in 1997, just over 3.0 million tons of cargo left the state of Maine for Canada, shipped almost entirely by truck. Total outbound tonnage to Canada is forecast to grow at a 3.7% average annual rate, reaching nearly 6.1 million tons by 2015. Water and rail borne freight are projected to grow more rapidly than truck freight over the forecast period, but each from a very small base.

Inbound tonnage to Maine from all of Canada totaled just under 5.0 million tons in 1997, with a fairly even distribution among modes. Total inbound shipments from Canada are expected to grow at an even faster 4.2% annual growth rate over the forecast period, reaching nearly 9.9 million tons by 2015.

Table 2-2 provides an indication of the direction of forecast Maine-Canada commodity flows by the end of the forecast period. The vast majority (77%) of all outbound Maine freight to Canada is expected to go to Quebec, and more than 80% of all outbound tonnage is projected to move in a westerly direction. Movements of inbound freight are in the opposite direction, with 64% of all inbound tonnage coming from New Brunswick and nearly 70% of all inbound tonnage arriving from the Atlantic Provinces.

Atlantic Canada

In 1997, 25.6 million tons of freight left Atlantic Canada, 81% by water, 13% by truck and 6% by rail. Inbound freight from the US is of considerably lower volume at 2.7 million tons in 1997. Rail and truck shares are greater for outbound traffic, but the outbound tonnage for each mode falls well short of the inbound tonnage.

Considerable growth is anticipated over the forecast period, with the total to the US increasing at an average annual rate of 6.2%, and the total from the US rising at 4.9%. The water share to the US will rise from its current high level, while both truck and rail shares will decline. From the US, the truck share will gain at the expenses of both water

and rail shares.

Outbound - From Maine

By Commodity - U.S. Destinations

The top three commodities (by tonnage) leaving Maine are paper, converted paper or paperboard products, and field crops. Together, these three commodities accounted for over half of all tonnage leaving the state, with paper alone accounting for 35% of outbound tonnage. Both truck and rail are important to the shipment of paper, with truck holding a 65% share. The truck share is nearly 100% for the other two of the top three exports.

After the top three commodities, nine other commodities had over 200,000 tons exported in 1997, and another 12 had in excess of 100,000 tons. The top 12 commodities account for 81% of outbound tonnage, and the second 12 for an additional 13%.

Total shipments are projected to grow at an average annual rate of 2.5% between 1997 and 2015. Paper shipments will grow at a slightly greater 2.6% and Converted Paper or Paperboard Products will grow at 2.9%. Shipments of household appliances are expected to grow at a very strong 8.7%.

By Mode - U.S. Destinations

The vast majority of cargo leaving Maine leaves by truck. In 1997 truck cargo account for 79% of outbound cargo, with rail and water accounting for 17% and 4% respectively. These shares are projected to remain stable through 2015. The top three exports overall (paper, paper/paperboard products, and field crops) are the top commodities moved by truck. The top exports by rail in 1997 were paper (1.7 million tons), pulp or pulp mill products (228,000 tons), and industrial chemicals (130,000 tons). Waste/scrap is the top commodity moved by water, with 428,000 tons exported in 1997 in total, nearly 82% of that tonnage was exported via water routes.

By U.S. Destinations and Largest Commodities ⁵

The Southeast US is the largest destination for cargo leaving the state of Maine. With 2.5 million tons of cargo leaving the state for Southeast US destinations, the region accounted for 18% of total tonnage exports in 1997. The Chicago and New York City/New Jersey areas are the second and third largest destinations for goods leaving the state with 1.7 million tons moving from Maine to Chicago and 1.4 million to the New York/New Jersey area. Boston, Washington D.C., and the Southwest, follow the top 3 destinations closely. The strongest growth is projected for shipments to the Southeast, with an average annual gain of 4.2% through 2015. Shipments to the Washington D.C. area and to the Southwest will increase in share, while those to Chicago, Boston, Philadelphia, and Kansas will decline in share.

⁵ Regional definitions used in this section are the same as those developed for the presentation of 1997 commodity flows. Maps identifying regions of origin and destination are presented in Chapter 4 of the Phase I Technical Report: Baseline Conditions.

Total leaving Maine to all US Destinations:	8,096,088		449,783		2.5%	

When examined by commodities to individual hubs, the commodity concentration is quite evident. The top four, and six of the top seven are shipments of paper to different hubs. The greatest geographic concentration is to the Southeast, which appears three times in the top ten entries. The Chicago area appears twice. Through 2015 shipments of paper to each of its top four markets are projected to grow faster than will total shipments of all goods. Particularly strong growth is forecast for paper shipments to the Southwest. The strong growth in household appliance shipments noted above will be concentrated in shipments to the Southeast.

In 1997, twelve commodity groups shipped more than 100,000 tons to any single destination, and ten regions received shipments of a single commodity of more than 100,000 tons in 1997. The single largest commodity-destination pair was shipments of paper to the Southeast region, with 923,903 tons shipped in 1997, 52% by truck and 48% by rail. In 2015 there will again be twelve commodity groups shipping over 100,000 tons to individual destinations, but there will be sixteen regions involved.

Inbound - To Maine

By Commodity - U.S. Points of Origin

Over 8.6 million tons of commodities were shipped to Maine from other States in 1997. Products of petroleum refining account for 2.5 million tons or 29% of the total, and almost all of this arrives by water. After petroleum products, and disregarding secondary traffic, the top three imports in terms of tonnage were abrasives and asbestos products, bituminous coal or lignite, and concrete, gypsum, or plaster. These three commodities account for 17% of total tonnage imports into the state indicating that imports are much more evenly distributed among the commodity categories than exports.

Between 1997 and 2015, total shipments are forecast to grow at an average annual 2.0%. Among the top twelve commodities in the table below, industrial chemicals and plastic material or synthetic fibers will grow most quickly, at 6.2% and 4.0%, respectively.

Products of petroleum refining and paving or roofing materials will each grow at just 0.8%. Imports of field crops will grow at only 0.3%, declining to 1% of total imports.

By Mode - U.S. Points of Origin

While on the outbound side, truck shipments clearly dominated, because of significant water shipments of petroleum products, inbound cargo is almost as likely to arrive by boat as it is by truck with 34% and 46% of tonnage imports respectively.

Table 2-9: Forecast of Inbound Maine Freight Tonnage by Mode: U.S. Points of Origin

Modes to Maine from Other US States	1997		2010		2015	
	Total	% of	Total	% of	Total	% of

Total:	8,623,474		11,275,701		12,336,910	
Growth 1997-2015:	Total Change		Annual Average		Annual Growth	
	1997-2015		Increase: 97-15		Rate: 97-15	
Rail	1,042,880		57,938		2.7%	
Truck	2,176,361		120,909		2.4%	
Water	494,194		27,455		0.9%	
Total:	3,713,436		206,302		2.0%	

Top commodities moved by rail include motor vehicles or equipment, miscellaneous food preparations, and industrial chemicals. By water, as mentioned, the top commodity is petroleum products which account for 84% of total imports by water. Petroleum products are followed by bituminous coal or lignite, with 272,869 tons imported via water. The main commodities shipped by truck include concrete, gypsum, or plaster (282,903 tons), primary forest materials (206,739 tons), and industrial chemicals (184,801 tons). Both rail and truck shares are projected to grow between 1997 and 2015, with a total of six share points to be taken from water. This is substantially the consequence of modest growth in imports of the petroleum product where waterborne commerce is concentrated.

By Origin and Commodity

The top three origins of Maine's imports are the New York/New Jersey area, Southeast USA, and Boston. By 2010 these three origins are projected to account for 53% of tonnage imports, growing to 54% by 2015. This picture is dominated by petroleum coming out of New York/New Jersey, and if this is ignored, then the Southwest is added to the top origins list.

Total entering Maine from US Origins :		8,096,088		449,783		2.5%	

Because Maine imports a wide variety of goods from a wide variety of sources, there are only twelve origin-commodity pairings with 1997 tonnage accounting for 1% or more of the total. And, among the twelve pairings, products of petroleum refining and secondary traffic each hold four positions. Between 1997 and 2015 particularly strong growth is expected in abrasives and asbestos products from the Southeast (3.1% average annual growth) and from southern Vermont (3.2%), in industrial chemicals from the Southeast (4.5%) and from New York/New Jersey (3.4%), and in plastic materials and synthetic fibers from Boston (4.2%) and from the Southeast (4.6%).

Products of petroleum refining grow slowly from nearly all sources, with those from Philadelphia actually declining at an average 0.4% per year. Also declining will be field crops from the Detroit area (-0.2%) and paving or roofing materials from New

York/New Jersey -0.6%).

Outbound - From Atlantic Canada

By Commodity

In 1997, 25.6 million tons of freight left Atlantic Canada for the US. Of this, 4.9 million tons moved by either rail or truck. Pulp and pulp mill products accounted for 1.2 million of the truck and rail tons, with paper another 0.8 million. Sawmill or planing mill products were just over 0.5 million tons. The next three for truck and rail shipments were miscellaneous nonmetallic minerals; concrete, gypsum or plaster; and tires or inner tubes. The top six truck and rail commodity groups mentioned above accounted for 60% of outbound freight.

By Mode

In 1997, 13.3% of outbound Atlantic Canada tonnage to the US was shipped by truck. Top trucked commodities include paper, pulp and pulp mill products, sawmill and planing mill products, nonmetallic minerals and field crops. Rail freight accounts for only 5.9% tonnage that left Atlantic Canada for the US in 1997. The top rail commodities include paper, pulp and pulp mill products, and sawmill and planing mill products. The water mode dominated, with an 80.8% share. Of the water total, approximately one third was miscellaneous nonmetallic minerals, one quarter was iron ore, and another quarter was products of petroleum refining.

Table2-11: Forecast of Atlantic Canada Freight Tonnage by Mode: U.S. Destinations

Modes from Atlantic Canada to the US	1997		2010		2015

By Destination

Quebec, Ontario, and Maine are the three largest destinations, by a large margin, for freight leaving Atlantic Canada by either truck or rail, accounting for 57% of tonnage leaving Atlantic Canada.. The remaining six of the top nine destinations are all within the US.

The table below includes only shipments to US regions. Water's large overall share translates into the top entries being those for which water shipments are substantial. The largest entry for which truck would be relevant is shipments of pulp and pulp mill products, with a total of 278,000 tons in 1997, of which 207,000 moved by truck, with the rest by rail. Similarly, the largest entry when ranked by rail tonnage would be shipments of pulp and pulp mill products to Green Bay, with 115,000 out of 119,000 tons moving by rail.

With few exceptions, for both truck and rail it is paper and products of pulp and paper mills that are important. Among the exceptions are:

- ▶ Truck shipments of miscellaneous nonmetallic minerals to New York/New Jersey (150,000 tons in 1997 growing to 696,000 in 2015)
- ▶ Truck shipments of fresh fish to Boston (86,000 tons in 1997 growing to 110,000 in 2015)
- ▶ Truck shipments of miscellaneous nonmetallic minerals to the Southeast (53,000 tons in 1997 growing to 247,000 in 2015)
- ▶ Truck shipments of tires and tubes to the Southeast (49,000 tons in 1997 growing to 115,000 in 2015)
- ▶ Rail shipments of sawmill or planing mill products to the Southeast (42,000 tons in

1997 growing to 52,000 in 2015)

- ▶ Rail shipments of sawmill or planing mill products to Albany (37,000 tons in 1997 growing to 46,000 in 2015)
- ▶ Rail shipments of tires and tubes to the Southeast (33,000 tons in 1997 growing to 77,000 in 2015)

Inbound - To Atlantic Canada

By Commodity

In 1997, the Canadian Atlantic provinces received 2.6 million tons of freight from the US. This total is projected to grow at an average 5.3% per year through 2015, reaching 6.7 million tons. The five largest inbound freight are products of petroleum refining (393,000 tons), bituminous coal or lignite (339,000), pulp or pulp mill products (332,000), waste or scrap (185,000) and clay ceramic or refractory minerals (178,000). These collectively account for 54% of all tonnage from the US.

By Mode

Both truck and water shipments are significant for inbound tonnage, accounting in 1997 for 44% and 40%, respectively. Inbound truck freight amounted to 1.2 million tons in 1997. Important commodities for inbound truck freight are primary forest materials (accounting for a third of the truck total) and waste or scrap (8% of the total). Field crops at 4% are the next largest, with the remaining 55% diffused over many commodities. Truck imports of primary forest products are projected to grow at an average annual rate of 3.5% through 2015. Trucked receipts of waste and scrap will grow at a much more rapid 8.2% over the same period. Over the forecast period, trucks will gain share, drawing from both rail and water. For rail freight important commodities include clay or refractory minerals at 25% of 1997's total, broken stone or riprap at 14%, plastic material or synthetic fibers at 12%, and grain mill products at 7%. The key commodities entering by water include products of petroleum refining, bituminous coal or lignite, chemical or fertilizer minerals, and waste or scrap.

By Origin

Quebec and Ontario are by far the largest originators of Atlantic Canada imports, forecast to account for 70% of combined truck and rail inbound freight in 2010, but declining to 66% by 2015. Each of these regions will ship over four million tons of freight to Atlantic Canada. The next largest origin in terms of tonnage is Maine,

followed the US South. Maine is project to provide 8% of shipments to Atlantic Canada in 2010, growing to 9% by 2015. The US Southeast will contribute 5% (608,432 tons) in 2010 and 6% (777,120 tons) in 2015. Unlike the situation with destinations for Atlantic Province exports, Canadian provinces in addition to Quebec and Ontario are among the top import 9 origins.

As with exports from Atlantic Canada, the following table commodities by region includes only shipments from US regions. These are the top 20 items from a table with at total of nearly 2500 entries. The first six entries involve different commodities but that three of them are shipments from the Southeast. Energy products (products of petroleum refining and coal) hold a large number of the top spots. Each of the first four items is projected to decline between 1997 and 2015. The fifth item, waste or scrap originating in Boston will grow sufficiently fast to take the second spot by 2015.

Among the modal insights behind the commodity/origin region rankings are:

- ▶ Truck shipments are entirely responsible for shipment of primary forest products for REMI region 1 (Aroostook County) in Maine. Truck shipments of fresh fish to Boston (86,000 tons in 1997 growing to 110,000 in 2015).

- ▶ Trucks are important to the rapidly growing shipments of waste and scrap, not only from Boston (42,000 in 1997 to 171,000 in 2015), but also from Albany (28,000 to 113,000).
- ▶ Trucks carry the majority of fresh vegetables from the southwest, an activity projected to grow from 20,000 tons in 1997 to 82,000 in 2015, an average annual growth of 8.2%.

Total entering Atlantic Canada from US Origins:		3,637,530		202,085		4.9%	

- ▶ Trucks are used for 96% of motor vehicles or equipment moving from Detroit and for all moving from Minnesota. The combined tonnage from both regions is forecast to grow from 33,000 tons in 1997 to 78,000 in 2015, a 4.9% growth rate.

- ▶ For movement of waste or scrap from Boston, water shipments are greater importance than trucks (92,000 in 1997 to 380,000 in 2015).
- ▶ Water is the critical mode for shipments of coal, with originations in New York/New Jersey (178,000 in 1997 to 323,000 in 2015), Cleveland (91,000 to 165,000), and Erie (70,000 to 127,000).
- ▶ Rail is important for shipments of clay, ceramic, or refractory minerals from the Southeast and from New York/New Jersey. Water is close runner-up for shipments from the Southeast, but not from elsewhere.
- ▶ Although the total volumes are not great, rail is used for shipping grain mill products from Chicago, Iowa, and Buffalo. In each case, rail carries over 90% of the total, with trucks moving the rest.

Conclusion

Table 2-17 summarizes the implications of the preceding analysis as they relate to potential demand for an east-west highway through Maine. The table shows current (1997) and projected (2015) bidirectional truck freight movements between Maine/US, Maine/Canada, and Atlantic Canada/US origin destination pairs that are likely to be moved through Maine. In addition, the table shows combined Canada-Canada truck and rail flows that are potential candidates for diversion through Maine if an improved east-west transportation link were developed. As shown, total bi-directional truck freight carried to, from and through Maine is projected to grow by almost 1.0 million tons per year through 2015. Total bidirectional truck freight that is already likely to move to, from or through Maine, is forecast to grow from 22.6 million tons to 40.0 million tons by 2015. This represents an average growth rate of 970,000 tons (3.2%) annually over the forecast period.

Table 2-17: Summary of Projected Truck Freight Movements to, Through and Around Maine, 1997-2015

Annual Truck Freight Movements by Origin-Destination Pairs	Bi-Directional Flows		Growth: 1997-2015		
	(Millions of Tons)		Total	Annual	Annual
	1997	2015	Change	Average	Growth Rate
Maine-US	15.2	23.8	8.6	0.48	2.5%
Maine-Canada	4.8	9.2	4.4	0.25	3.7%
Canada-US, Through Maine	2.6	6.9	4.3	0.24	5.6%
Subtotal: Truck Freight to, from and Through Maine:	22.6	40.0	17.4	0.97	3.2%
Potential Diversion:					
Canada-Canada Truck & Rail:	11.4	14.7	3.3	0.18	1.4%
Total E-W Highway Potential:	34.0	54.7	20.6	1.15	2.7%

Projected growth in the tonnage of commodities moved by truck will generate substantial increases in traffic to, from and through Maine, by the time the proposed east-west highway comes on line. Even if one assumes a fully loaded average of 40 tons per shipment, the projected growth in commodities moved by truck, will generate a minimum required increase of nearly 25,000 truck trips per year over the forecast period. By 2015, annual truck movements on state highways may be 500,000 higher than 1997 levels.

The potential to divert Canada-Canada freight movements through Maine is modest relative to projected truck volumes that are already likely to move through the State. Roughly 11.4 million tons of truck and rail freight moved between Atlantic Canada and the Central and Western Provinces in 1997. This volume is projected to grow to 14.7 million tons by 2015, an average of 180,000 tons (1.4%) per year over the forecast period. Some portion of this freight could also be diverted onto a Maine East-West Highway. As indicated in the table however, current and projected truck freight generated by O-D pairs that are already likely to move to, from or through Maine, greatly exceed Canada-Canada flows in both the aggregate and in their projected rates of growth over the 18 year forecast.

III

Tourism Survey Research Findings

Overview

As part of the economic impact analysis of the effects of the proposed East-West Highway on the State of Maine, Davidson-Peterson Associates was subcontracted by RKG Associates to conduct a program of research on tourism. More specifically, the goal of the research was to estimate how potential time savings, associated with improved highway access to Central and Northern Maine, might influence future tourism travel to or through the State.

The scope of the research was therefore focused to potential external tourism markets located to the east and west of Maine, which would realize improved access to the interior of state via any of the conceptual highway corridors described in the introduction to this technical report. The research also focused on those tourism destinations within Maine that would be made more accessible to these external markets.

Improved east-west transportation routes in Maine might also be expected to alter tourism travel patterns among Maine residents, or perhaps change the ultimate Maine destinations of other tourists, once they are inside the State. However, the scope of this survey research was limited to measuring the potential economic development impacts of increased, externally generated travel to or through Maine. The potential of an east-west highway to alter the existing regional distribution of tourism spending in Maine was beyond the scope of this survey effort, but will be addressed in later reports.

Part 1 of this chapter describes the findings of interviews with Maine tourism officials, completed in January of 1999, in those regions that may be serviced by an east-west highway. Tourism leaders in various Maine destinations were asked to share their impressions concerning the need for and desirability of an east-west highway. Part 2 of this chapter reports the findings of a telephone survey of selected key market areas of the United States and Canada, that would be made more accessible to Maine if improved east-west transportation routes were constructed within the state. This residential telephone survey was conducted in January and February of 1999 and included 2,000 residents and households in the selected market areas.

Additional detail concerning the scope, methodology and findings of the tourism research program is provided below.

Survey of Key Tourist Destinations

Introduction

The purpose of this portion of the study is to gather impressions from those in Maine who serve Canadian tourists as well as tourists from within the US concerning the need

for and desirability of the east-west highway. In so doing we undertook a number of tasks including:

- ▶ Identify tourism destinations whose visitors could benefit from the building of a new east-west highway in the state of Maine,
- ▶ Identify tourism leaders in each destination, and
- ▶ Interview these tourism leaders.

Key tourism destinations in Maine that could be affected by the building of a new east-west highway in the state of Maine were identified. These destinations are:

- ▶ Bar Harbor/Ellsworth
- ▶ Rockland/Camden
- ▶ Bangor
- ▶ Greenville
- ▶ Millinocket
- ▶ Bethel
- ▶ Old Orchard Beach
- ▶ Wells/Ogunquit
- ▶ Rangely
- ▶ Carrabasset Valley

We interviewed Chamber of Commerce executive directors or presidents in each of the areas and asked them to suggest other tourism leaders in their communities. We also contacted non-regional tourism leaders such as retail interests, Ski Maine Association, the Forum Francophone Des Affaires, and Bangor International Airport. A complete list of the tourism leaders with whom we spoke and various illustrative verbatim comments from the discussions may be found in the Appendix A.

Summary Findings

The Role of Canadian Visitors

The role of Canadian visitors varies by region. Tourism leaders in each region report different experiences in the proportion of their visitors who are from varying regions in Canada.

- ▶ The leaders in the mountain areas report that they have a small percentage of visitors from the Maritime Provinces. Fewer visitors, they report, come from Quebec and Montreal. They feel Canadians from those areas have mountains in their own areas and are not inclined to travel to Maine to experience the mountains. There is also competition from Vermont and New Hampshire since these states also offer the mountain experience.
- ▶ Leaders in Greenville, Millinocket, and Rangely report they have very few visitors from Canada. They feel this is due to the fact that their region is much like regions in Canada. They feel they just do not have anything different to offer Canadians that

they can't get in their own country.

- ▶ The leaders in the mid-coast regions and downeast Maine say they have very few Canadian visitors to their area. They feel that those in the Maritime Provinces are not drawn to their area because they have the coastline in their own areas. Some feel Canadians from Quebec and Montreal are drawn to the southern coast not the mid-coast. One person we spoke with feels the mid-coast region is an upscale destination and cannot attract the families from Quebec and Montreal as the southern coast does. Another says he/she is not sure why Canadians do not come but thinks it could be due to the fact that the mid-coast region is not French-speaking.
- ▶ The leaders in the southern coast report that they have many Canadian visitors. They are reportedly coming primarily from the Quebec area and are likely to be French-speaking. Although the percentage of Canadian visitors to the southern coast is estimated at up to 30% of all visitors in some areas, the number has declined over the past few years. Those in the southern region attribute this decline to the currency exchange rate.

Canadians' Access to the State of Maine

Opinions on Canadians' ease of access to Maine vary among tourism leaders but not necessarily by region. Some believe that poor access to and through the state deters Canadian visitation. Others say that although travel from Canada to parts of Maine may be difficult, it does not deter Canadian visitors from coming here. Some feel access to Maine is more of a problem for other areas such as Vermont and upstate New York.

Most tourism leaders feel that the biggest (current) impediment to Canadian visitation is the currency exchange rate. Many feel that the decline in the value of the Canadian dollar has caused a decline in the number of Canadians visiting the state of Maine. One leader feels that immigration and customs is more of a problem than the exchange rate. Only a few think highway access is the biggest impediment to Canadian visitation.

Awareness of the Proposed East-West Highway Among Maine Tourism Officials

Maine tourism leaders are generally aware that an east-west highway has been proposed. Most say they have been hearing about the highway for a number of years. Although some cannot remember where they first heard about the highway, the majority say they heard about the proposed highway in the news. Others have heard politicians talking about the highway, particularly around the elections, or from Chamber of Commerce meetings. Some have heard where the highway may be located; others have not.

Most tourism leaders whom we spoke with think an east-west highway will be built. Most feel it will not happen, however, for a number of years. Few think it will happen in the next ten years.

About half of the people whom we spoke with have an opinion on where the highway should be located. Those who do not have an opinion think it should be determined by engineering, environmental, or planning considerations.

Most of those that do have an opinion feel the highway should continue along Route 9 through Bangor but are split on whether it should go along Route 2 through Bethel or along Route 27 through Coburn Gore. Only a few that deviate from this route. These

people feel it should go farther north along Route 16 and Route 201 out through Jackman. One leader feels it should go through Portland and connect New Hampshire and Vermont.

Perceived Benefits of the Proposed Highway

The benefits of an east-west highway in the state of Maine are seen as: improved access to and through Maine; increased visitation from those in Canada, New Hampshire, Vermont, and upstate New York; safer, more efficient roads carrying tourists, residents, and commerce; and increased flow of commerce.

- ▶ **Many tourism leaders feel that an east-west highway would improve access to and through the state.** Some feel that an east-west highway will allow tourists to combine trips. Instead of going either to the mountains or to the coast, they may be more likely to combine the trips and go to both regions on one trip. Some also feel that this will increase the number of visitors from Canada or other New England areas. An east-west highway, some feel, will provide an alternative to traveling on Route 1 to get to the coast.
- ▶ **Many feel that the increased access will attract more visitors from Canada, New Hampshire, Vermont and upstate New York.** Few even believe it would increase European visitation by helping marketing campaigns for the fly-drive program.
- ▶ **Many tourism leaders, especially in the central and northern regions, think that one of the benefits of an east-west highway is safer, more efficient roads.** Although some feel the road system that exists presently is part of the character and charm of the state of Maine, many feel that improved road systems such as an east-west highway, are vital to the future of Maine.
- ▶ **Some tourism leaders feel that the east-west highway would increase the flow of commerce in the state of Maine.** Currently, on some roads in Maine commerce is slowed.
- ▶ **An east-west highway would increase the flow of commerce within the state.** Some feel it would also open up commerce between Canada and Maine as well as commerce from Canada to Canada or to other parts of the United States.

Perceived Problems of the Proposed Highway

Many of the tourism leaders that we spoke with see no problems with the proposed east-west highway from a business perspective. Those who do have concerns feel; visitors may move too fast through the state, the highway will consume limited financial resources in the state, and the highway may have negative environmental impacts.

- ▶ **Some tourism leaders feel that Maine is as the slogan says "the way life should be".** They feel the slower pace of the road system is in keeping with the way of life in Maine and that high speed highway systems in the state will detract from the Maine experience. They also feel that the faster pace on highways will cause many tourists to pass too quickly through Maine. They fear this will cause them to miss the quaint towns and scenery that attract people to the state.
- ▶ **Another concern is that limited financial resources will be absorbed by this project and there will not be money left to go to other projects that may be necessary.** Of particular concern is the condition of existing roads throughout the state of Maine.

A few feel that Maine should make sure all existing roads are up to code before building the east-west highway.

- ▶ Another concern is the environmental impacts of such a project. Also, if the road dissects rural communities or farmlands or is placed in an environmentally sensitive location it could ultimately detract from the tourist experience.

Summary

Our findings suggest that the proposed east-west highway will have modest support from those in the tourism community. The most enthusiastic supporters seem to be from the Bangor area - the focal point for the new road regardless of where it enters or leaves the state. Tourism leaders in some regions do not anticipate an increase in Canadian visitation to their areas. Leaders in those regions where the proposed highway corridors would be located do not currently have significant numbers of Canadian visitors and do not expect a lot of growth in this market. Increased visitation resulting from the highway might therefore benefit existing Canadian destination areas in the south, rather than in northern Maine. At the same time, the majority of tourism leaders do feel the highway will benefit tourism in the State overall by making access easier and quicker for both Canadians and northern New England residents. Tourism leaders also believe that the road will permit better circulation of tourists in Maine, perhaps extending their stays.

Residential Telephone Survey

Introduction and Methodology

This portion of the study was conducted from January 1999 to February 1999 and consisted of a telephone survey of 2,000 residents in selected key market areas of the United States and Canada. These market areas were selected because they are either currently recognized as tourism markets for Maine, or are geographically located in areas that would be made more accessible to Maine via one or more of the proposed East-West Highway corridors.

This survey was conducted to assess the tourism potential of a new East-West Highway. The specific objectives of the research were:

- ▶ To determine the amount of travel to and through the State of Maine from the key market areas in 1997 and 1998;
- ▶ To evaluate characteristics of these trips to and through Maine, including:
 - ▶ Time of year the trip was taken,
 - ▶ Purpose of the trip (business or pleasure),
 - ▶ Number of people on the trip,
 - ▶ Number of nights spent in Maine, and
 - ▶ The primary destination.
- To determine what routes are generally used in traveling to and through Maine;
- To assess anticipated travel to and through Maine in 1999; and
- To test the theoretical impact of improved highway access and travel time savings on

future visitation to the state.

Davidson-Peterson Associates purchased a randomized list of telephone numbers in 11 tourism market areas surrounding Maine. These areas were selected based upon their proximity to the five conceptual highway corridors and their resulting potential to benefit from reduced travel times into the interior of the State, if an east-west highway were built. Telephone interviews were conducted in each of these areas, in the quantities indicated in Table 3-1.

Table 3-1: Market Areas Surveyed

	<u>Number of Interviews Conducted</u>
CANADA (Total)	<u>1,500</u>
Ontario/Quebec	1,300
• Montreal, Quebec	500
• Quebec City, Quebec	300
• Toronto, Ontario	500
Atlantic Provinces	200
• Moncton, New Brunswick	50
• St. John, New Brunswick	50
• Fredericton, New Brunswick	50
• Halifax, Nova Scotia	50
UNITED STATES (Total)	<u>500</u>
• New Hampshire	125
• Vermont	125
• Western New York	125
• Eastern New York	125
TOTAL	2,000

Due to sampling constraints, phone calls were restricted to primarily urban areas. In addition, the only areas surveyed were those that could become more accessible to Maine should an East-West Highway be constructed. Therefore, the sample may not be completely representative of Maine's entire tourism market, as many of these regions are too geographically distant from Maine to generate day trip visitors.

The questionnaires used for each area sampled and the detailed data tabulations may be found in Appendix B.

Limitations of the Survey Findings

There are certain issues in the analysis of this survey that the reader should be cautioned about.

First of all, telephone survey respondents cannot be expected to comment on their potential use of highway facilities that would take several years to build. Therefore, a hypothetical case had to be created in which respondents were asked whether or not they would alter their travel plans over the coming season if the proposed highway existed today. It is difficult to project one-year plans in a hypothetical situation to long range projections of increased visitation resulting from an East-West Highway. Travel plans for 1999 may differ greatly from travel plans over the next ten years, for example.

Second, in a telephone survey, one cannot get very specific in terms of describing the actual locations of potential East-West highway corridors. This would have certainly resulted in a survey that was too long and would have confused most respondents who are not likely to be thoroughly familiar with Maine and its bordering states and provinces. Therefore, respondents were presented with an estimated maximum reduction in travel times to a single location from their home.

In addition, those respondents who indicated they would increase travel to Maine were not asked to speculate on where they would go. This might have been interesting data to collect, but, again, the length and clarity of the survey would have been compromised. Therefore, it is probable that some respondents answered the question assuming that similar time savings would apply to several destinations in Maine.

Another issue has to do with respondents' estimates of planned travel to and through Maine in 1999. In the survey, respondents were first asked to elaborate on trips they had taken to and through Maine during a two-year time period (1997 through 1998). After completing this portion of the survey, they were then asked about their plans for travel to and through Maine during 1999. It is our hypothesis that the majority of respondents did not switch from thinking about a two-year time period to a one-year time period. Therefore, we believe that the estimates given for planned 1999 travel are likely double what they should be.

This can be partially substantiated by examining the data more closely. For example, respondents in Montreal state that, in 1997 and 1998, they took an average of 0.13 trips to Maine (two years). These same respondents then stated that they planned to take an average of 0.14 trips to Maine in 1999 (one year). This same rough pattern is evident throughout the remaining areas sampled. Therefore, we have adjusted the 1999 data to reflect our hypothesis. All means calculated for planned 1999 travel have been divided by two to adjust for the fact that respondents were likely to be answering for a two-year time period. As our intentions were to measure market response to the East-West Highway and not to predict 1999 travel plans to Maine, this issue is not of extreme concern.

In addition, the survey was not successful in determining the percentage of people who go around Maine versus those who travel through Maine. Therefore, in dealing with respondents' planned 1999 travel through or around Maine, figures are presented in sum only. There is no distinction noted between those who travel through Maine using Maine roads and those who travel around Maine using the Trans-Canada highway.

The combined effects of all of these limitations probably tend to overstate market response to the highway. Also, we did not survey in-state residents for budgetary reasons. To the extent that an East-West Highway would reduce travel times within the state, an increase in in-state tourism travel might also be expected, however, this was beyond the scope of this survey to estimate.

Demographic Characteristics of the Respondents

The demographic characteristics of the survey respondents are shown in Table 3-2 and can be summarized as follows:

- Twenty-nine percent of the respondents are between the ages of 18 and 34, and 27% are between the ages of 35 and 44.
- Six in ten have at least a two-year college degree (59%).
- Fifty-eight percent of the respondents are female, and 42% are male.

Table 3-2: Demographic Characteristics of the Sample

Age Distribution of Survey Respondents

18 to 34	29%
35 to 44	27%
45 to 54	20%
55 to 64	10%
65 or older	13%

Educational Attainment of Survey Respondents

Primary school/some high-school	12%
High-school graduate	27%
Two-year college degree	21%
Four-year college degree	26%
Post-graduate work	12%

As indicated in the table, a large proportion of the sample is young and rather well-educated; 56% are younger than 45 years and 38% have at least a four-year college degree. A comparable study conducted by Longwoods International (Maine's Canadian Travel Market - 1997 Travel Year) resulted in 45% of the sample being under the age of 45. Therefore, our younger sample could be assumed to be more likely to travel; this point should be noted in analyzing the results of respondents' travel habits and plans.

Survey Findings

1997 and 1998 Trips To and Through Maine

Travel to Maine

Respondents were initially asked how many trips they took in 1997 and 1998 to sites in Maine. The mean number of trips taken to Maine in 1997 and 1998 ranged from 0.02 trips per household (Toronto residents) to 1.63 trips per household (New Hampshire residents). In the 11 areas sampled, the average number of trips per household taken to Maine in 1997 and 1998 was 0.28.

Table 3-3: Mean Number of Trips Taken to Maine

Montreal	0.13	Halifax	0.12
Quebec	0.11	New Hampshire	1.63
Toronto	0.02	Vermont	0.82
Moncton	0.28	Western New York	0.03
St. John	1.06	Eastern New York	0.18
Fredericton	1.00		

Using the household counts shown in Table 3-4 below, these means were projected to the total households. For example, households in Montreal took an average of 0.13 trips to Maine in 1997 and 1998. The mean number of trips (0.13) was multiplied by the number of households in Montreal (1,235,720) to estimate the total number of trips to Maine from residents of each area (160,643 for Montreal).

Table 3-4: 1990 Household Counts for Selected Areas

Montreal	1,235,720	Halifax	118,320
Quebec	253,365	New Hampshire	7,576
Toronto	1,366,700	Vermont	23,974
Moncton	36,735	Western New York	229,116
St. John	45,170	Eastern New York	65,046
Fredericton	26,400		

In projecting each of these figures to household counts in each area, there were an estimated 365,201 trips to Maine in 1997 and 1998 for these selected areas.

The majority of these trips (58%) were taken in 1998. Those areas that produced the largest increase in travel from 1997 to 1998 were the United States (32% in 1997 and 63% in 1998) and the Atlantic Provinces in Canada (33% in 1997 and 60% in 1998). Residents of Quebec province took fewer trips to Maine in 1998 than in 1997 (59% in 1997 and 41% in 1998).

The average number of people on each of these trips to Maine was 2.85, with a high of 2.94 people on trips originating in New Hampshire and a low of 1.78 people on trips originating in Moncton, New Brunswick. Visitors spent an average of 2.88 nights in Maine. Travelers from Montreal spent an average of 3.65 nights, while those from Fredericton, New Brunswick spent an average of 0.91 nights in Maine.

These results compare favorably with a similar study conducted by Longwoods International (Maine's Canadian Travel Market - 1997 Travel Year). Though the average number of people in each travel party is slightly higher in this study compared with the Longwoods International study, this study did not capture a large number of day travelers due to the areas sampled. While roughly 23% of these total trips to Maine were day trips (versus 85% in the Longwoods International study), as one would expect, there were no day trips originating in Halifax, Toronto, or New York state.

Travelers were most likely to mention Portland as their primary destination on their trip to Maine (13%). Trips to Old Orchard Beach (8%) and Calais (7%) were also quite prevalent. Twenty-six percent of these 1997 and 1998 trips were to destinations in York County, and 22% were to destinations in Cumberland County. Thirteen percent of respondents listed sites in Washington County and Hancock County as their primary destination.

By determining the average number of people on each trip and the average number of nights spent in Maine on each trip, we can estimate that Maine received visitors in the amount of 2,824,032 person-nights during 1997 and 1998 from the sampled areas.

Travel through Maine

Respondents were also asked about trips they had taken through Maine on their way to other states or provinces. The households surveyed took an average of 0.13 trips through Maine in 1997 and 1998. Residents of Fredericton, New Brunswick took an average of 0.62 trips through Maine, while residents of Western New York took an average of 0.01 trips through Maine in 1997 and 1998.

Table 3-5: Mean Number of Trips Taken Through Maine

Montreal	0.13	Halifax	0.20
Quebec	0.10	New Hampshire	0.29
Toronto	0.04	Vermont	0.10
Moncton	0.46	Western New York	0.01
St. John	0.36	Eastern New York	0.03
Fredericton	0.62		

Projecting the mean number of trips taken through Maine to household counts in these areas yields an estimate of 322,647 trips through Maine in 1997 and 1998. Roughly equal percentages of these trips were taken in 1997 (51%) and 1998 (49%).

The average number of people on each of these trips through Maine in 1997 and 1998 was 2.79. Residents of Montreal had the highest average number of people on each trip (2.89), while residents of Western New York had the lowest average (2.00). While traveling through Maine on their way to another destination, travelers spent an average of 1.27 nights in Maine. Residents of Vermont spent an average of 3.00 nights in Maine while traveling through the state, and residents of Montreal spent an average of 0.75 nights in Maine.

Sixty-one percent of these trips through Maine were to destinations in the United States, while 39% were to destinations in Canada. Examining specifically those trips through Maine that originated in Canada, 76% were to United States destinations, and 24% were to Canadian destinations.

When traveling through Maine in 1997 and 1998, 11% of travelers listed Nova Scotia as their primary destination. Florida was the primary destination of 9% of the trips through Maine, and New York was the destination for 8% of the trips.

By examining the average number of people on each trip through Maine and the average number of nights spent in Maine on these trips, we can estimate that Maine received visitors traveling through the state in the amount of 876,183 person-nights during 1997 and 1998 from the sampled areas.

In combining the projected estimates of travel to Maine and travel through Maine in 1997 and 1998, there were an estimated 687,848 trips to or through Maine in the last two years, and an estimated 3,700,215 person-nights spent in Maine during these trips.

Looking specifically at Canadian overnight travel to Maine, approximately 573,058 Canadian overnight travelers visited Maine in 1997. That comprises only 52% of the total Canadian overnight travelers to Maine in 1997 (1.1 million overnight visitors according to Maine's Canadian Travel Market - 1997 Travel Year; Longwoods International).

Routes Used in Traveling To or Through Maine

Travelers were asked to indicate which routes they generally use in traveling to or through Maine. The most frequent responses for each sampled area are shown below.

Table 3-6: Routes Used in Traveling To or Through Maine

<i>Quebec Province</i>	Route 73	(22%)
	I-95	(21%)
<i>Atlantic Provinces</i>	I-95	(49%)
	Rt. 9/the Airline	(26%)
<i>Toronto, Ontario</i>	I-95	(50%)
<i>United States</i>	Route 302	(24%)
	I-95	(22%)
	Route 2	(21%)

Planned 1999 Trips To and Through Maine

Planned 1999 Travel to Maine

When asked, respondents indicated that they plan to take an average of 0.15 trips to Maine in 1999. Residents of New Hampshire plan on taking the most trips (1.05), while residents of Toronto plan on taking the fewest trips to Maine in 1999 (0.03).

Table 3-7: Mean Number of Planned Trips to Maine in 1999

Montreal	0.07	Halifax	0.04
Quebec	0.06	New Hampshire	1.05
Toronto	0.03	Vermont	0.43
Moncton	0.16	Western New York	0.06
St. John	0.26	Eastern New York	0.07
Fredericton	0.31		

By projecting the average number of planned trips to Maine in 1999 to household counts, we can estimate that there will be 209,311 trips to Maine from the sampled areas in 1999. These projected 1999 trips are about the same as those taken in 1998.

In examining those respondents who indicated that they plan to travel to Maine in 1999, it is interesting to note that the majority of those who stated that they would travel in 1999 did not travel to Maine in either 1997 or 1998. (Of the 324 respondents who indicated that they plan to travel to Maine in 1999, 41% of them actually did travel to Maine in 1997 or 1998, while 59% did not travel to Maine in the past two years.)

Planned 1999 Travel through Maine

The households surveyed plan to take an average of 0.35 trips through Maine on their way to other destinations in 1999. Residents of Fredericton, New Brunswick plan to take the largest number of trips (0.88), while residents of Western New York and Eastern New York plan on taking the fewest trips through Maine in 1999 (0.05 and 0.06, respectively).

Table 3-8: Mean Number of Planned Trips Through Maine in 1999

Montreal	0.29	Halifax	0.40
Quebec	0.31	New Hampshire	0.14
Toronto	0.28	Vermont	0.11
Moncton	0.71	Western New York	0.05
St. John	0.64	Eastern New York	0.06
Fredericton	0.88		

By projecting the average number of planned trips through Maine in 1999 to household counts in these areas, we can estimate that there will be 962,818 trips through Maine from the sampled areas in 1999.

In analyzing only those respondents who plan to take a trip through Maine in 1999, exactly half had traveled through Maine in 1997 or 1998, and half had not traveled through Maine in 1997 or 1998.

Potential Impact of Improved Highway Access on Travel Patterns

Highway Impacts on Planned Travel to Maine

To illustrate the potential travel effects of an improved east-west transportation route through Maine, respondents were presented with a hypothetical situation in which highway improvements could be made that would reduce current driving times from their respective areas to certain locations in Maine, or locations which could be accessed by driving through Maine. The locations given to each respondent, and reduction in driving time reported to them, corresponded to general corridor locations and estimated maximum time savings associated with the five conceptual highway corridors. The phrasing of the question therefore depended on the area being surveyed, as illustrated in Table 3-9.

Table 3-9: Time Savings Presented to Tourism Survey Respondents

Market Area Surveyed	Trips To Maine		Trips Through Maine	
	Destination Given	Time Savings Given	Destination Given	Time Savings Given
Quebec City	Bangor, ME	Up to 30 min.	Maritime Provinces	Up to 1 hour
New Brunswick/ Nova Scotia	Bangor, ME	45 minutes	Montreal	1 hour, 25 min.
Montreal/Toronto	Bangor, ME	45 minutes	Maritime Provinces	1 hour, 25 min.
United States	Bangor, ME	Up to 1 hour	Maritime Provinces	Up to 1 hour, 30 minutes

Survey participants were then asked how this hypothetical time saving would impact their planned travel to Maine in 1999, as previously reported, *if the highway improvements already existed*. While 85% of the households interviewed indicated that they would take the same number of trips to Maine, 15% indicated that they would take more trips to Maine if highway improvements were in place. Thirty percent of those surveyed in St. John, New Brunswick indicated that they would take more trips to Maine, while 8% of those surveyed in Quebec City, Quebec indicated that they would take more trips.

Those who stated that they would take more trips to Maine if highway improvements were made indicated that they would take an average of 0.82 more trips to Maine in 1999. Residents of New Hampshire would take an average of 1.19 more trips to Maine, while residents of Fredericton, New Brunswick would take an average of 0.60 more trips to Maine in 1999.

In combining the estimated number of additional trips taken due to the highway and the estimated number of trips which remain the same, the numbers indicate that 346,267 more trips would be made to Maine in 1999 if proposed highway improvements were in place which provide comparable time savings to the conceptual east-west highway corridors.

This increase must be viewed cautiously, however, for two reasons. First, it should be understood that no single conceptual east-west corridor is capable of providing the time savings indicated in Table 3-9, to all of the market areas included in survey. Therefore, potential travel increases indicated by the survey, need to be adjusted downward when applied to a single corridor.

Secondly, as was mentioned earlier, a high percentage of those who indicated that they would travel in 1999 actually did not travel to Maine in 1997 or 1998. Of those respondents who stated that they would take more trips to Maine as a result of highway improvements, 67% had previously indicated that they did not plan to travel to Maine in 1999. In addition, among these same respondents who indicated that they would take more trips to Maine as a result of the highway improvements, 82% of them had not traveled to Maine in either 1997 or 1998. Travel time today would appear to be a reason not to visit Maine for some. In addition, respondents were not asked to indicate what their destinations would be on these additional trips or if these increased trips would be recurring over the next several years.

Highway Impacts on Planned Travel through Maine

Survey participants were then asked the same hypothetical question, whether they would increase their planned number of trips through Maine if a highway existed which reduced travel times to various destinations by traveling through the state. (See Table 3-9 for the time savings used.) Roughly 21% of those surveyed indicated that they would take more trips through Maine in 1999. Thirty percent of those surveyed in Fredericton, New Brunswick and 30% of those surveyed in New Hampshire indicated that the highway improvements would lead them to take more trips through Maine. Among residents of Quebec City, Quebec, only 11% indicated that they would take more trips through Maine if improved highways existed.

Those who indicated that they would take more trips through Maine if the proposed highway improvements were made would take an average of 0.77 more trips in 1999. Residents of St. John, New Brunswick indicated that they would take an average of 1.04 more trips through Maine, while residents of Halifax, Nova Scotia would take an average of 0.59 more trips through Maine.

In combining the estimated number of additional trips which might be taken due to the existence of improved highways, with the estimated number of trips which are not affected, improved highway access would result in an increase of 953,610 trips through Maine. This increase in trips is roughly triple the estimated impact of shortened travel times on trips to Maine destinations. A substantial portion of this increase is assumed to represent the potential diversion of already planned Canada/Canada trips off of the Trans Canada Highway through Maine. The results also indicate that shortened travel times through Maine could benefit Atlantic Canada tourist destinations, as well as encourage Canadians to travel more frequently to US destinations to the south and west of Maine.

Once again, this increase must be viewed cautiously. Of those respondents who stated that they would take more trips through Maine as a result of the proposed highway improvements, 70% had previously indicated that they did not plan to travel through Maine in 1999. In addition, among respondents who indicated they would take more trips through Maine as a result of highway improvements, 61% had not traveled through Maine in either 1997 or 1998.

The combined effects of travel time savings on potential trips to and through Maine and the associated number of person-nights spent in the State, are summarized in Table 3-10.

Table 3-10: Respondents' Reactions to Potential Time Savings Associated with Conceptual East-West Highway Corridors

Impact on Travel to Maine

Increase in Planned 1999 Trips to Maine	346,267
---	---------

Increase in Planned 1999 Person-Nights in Maine	2,968,387
---	-----------

Impact on Travel through Maine

Increase in Planned 1999 Trips through Maine	953,610
--	---------

Increase in Planned 1999 Person-Nights in Maine	3,191,695
---	-----------

Total Potential Impacts on to- and through-travel

Number of Trips	1,299,877
-----------------	-----------

Number of Person-Nights in Maine	6,160,082
----------------------------------	-----------

Conclusion

In conclusion, survey respondents indicate that they would significantly increase their travel to and through Maine, in response to reductions in travel times that could be accomplished through the construction of the conceptual east-west highway corridors. It can be concluded that the proposed highway improvements will be an incentive for a sizable proportion of people to travel to Maine more often.

It must be noted, however, that in comparing the increased travel to actual estimated travel in 1997 and 1998, the impacts are very large. As stated earlier, various limitations of the study may have contributed to an overstatement of the actual market response to a new highway. Specifically:

- Respondents were only asked to anticipate their travel plans over the next year; projecting these figures to continual travel over a longer period of time is difficult.
- Secondly, respondents were not presented with specific highway corridors; rather, they were given one single time saving to one particular destination. Respondents may have mistakenly assumed that this same time savings would apply to all of their normal destinations in Maine.
- Finally, the above results reflect market response to the maximum achievable time savings provided by all five of the conceptual corridors evaluated in this study. No single east-west corridor is capable of providing comparable time savings to all of the markets sampled by this survey.

All of these factors tend to be biased toward an overstatement of respondents' travel plans. Therefore, applying these survey results to project actual annual visitation to Maine to any single conceptual east-west highway corridor, must be approached very cautiously. It is not uncommon to discount respondents' stated intentions by large percentages in order to arrive at the actual actions they may undertake.

Regardless of these potential biases, however, it is important to note that the survey did find significant levels of recent travel to and through Maine, even from markets as far west as Toronto. A significant percentage of these respondents, about 15%, indicated

that their travel patterns to or through Maine could be influenced by an improved east-west transportation route within the state. Among some respondents, even very modest time savings, relative to the total trip length required to reach and return from Maine, would be sufficient to induce them to make more trips to or through the state. These results are encouraging and suggest that an east west highway would generate an increase in tourism travel to Maine.

IV

Business Survey Research Findings

Introduction

The following Chapter discusses in detail, the findings reported from 152 Maine businesses that participated in a survey of issues related to the proposed Maine East-West Highway. The purpose and objectives of this survey were to:

- Develop information concerning current patterns of trade and freight traffic to/from Maine companies and surrounding regions that would become more accessible to the State if an east-west highway were built;
- Gain insights into how businesses might respond to potential improvements to east-west transportation routes through Maine;
- Determine how Maine businesses perceive their likelihood of use, and resulting benefits to be gained from the five conceptual corridors, as a basis for ranking the alternatives;
- To uncover potential regional variations of business opinion regarding the potential benefits to be derived from and resulting need for an east-west highway through Maine;
- Obtain information that can be used to help quantify business (truck) traffic growth, as well as transportation cost savings, associated with each of the proposed corridors; and
- Solicit opinions on a variety of issues related to US/Canada trade, including perceived trade opportunities and impediments, the potential contribution of an east-west highway toward increasing trading relationships with Canadian businesses, and the possible effects of tolling the highway.

The scope of the survey research also included comparable questionnaires sent to both Canadian companies and Northeastern US firms, in locations that would potentially benefit from a more direct east-west highway connection through Maine. Returns from each of these efforts were disappointingly low, with each resulting in return rates of less than two percent. Because such low returns have limited usefulness, we have not included a detailed presentation of those survey results in this technical report. However, some of the returned information is relevant and will be considered in the impact analysis phase of the study.

Methodology

The methodology used in this analysis was a direct mail survey to approximately 1,300 Maine businesses. The survey mailing list was not intended to reflect a random sample of all Maine employers. Rather, the sample was constructed to return data from a well-represented cross-section of the State's largest companies, in those industries which are

most sensitive to transportation issues. To the extent that an east-west highway could generate economic benefits to existing Maine employers, respondents to this survey would be most likely to understand the implications of such project, because any resulting transportation cost savings or productivity gains would benefit them directly.

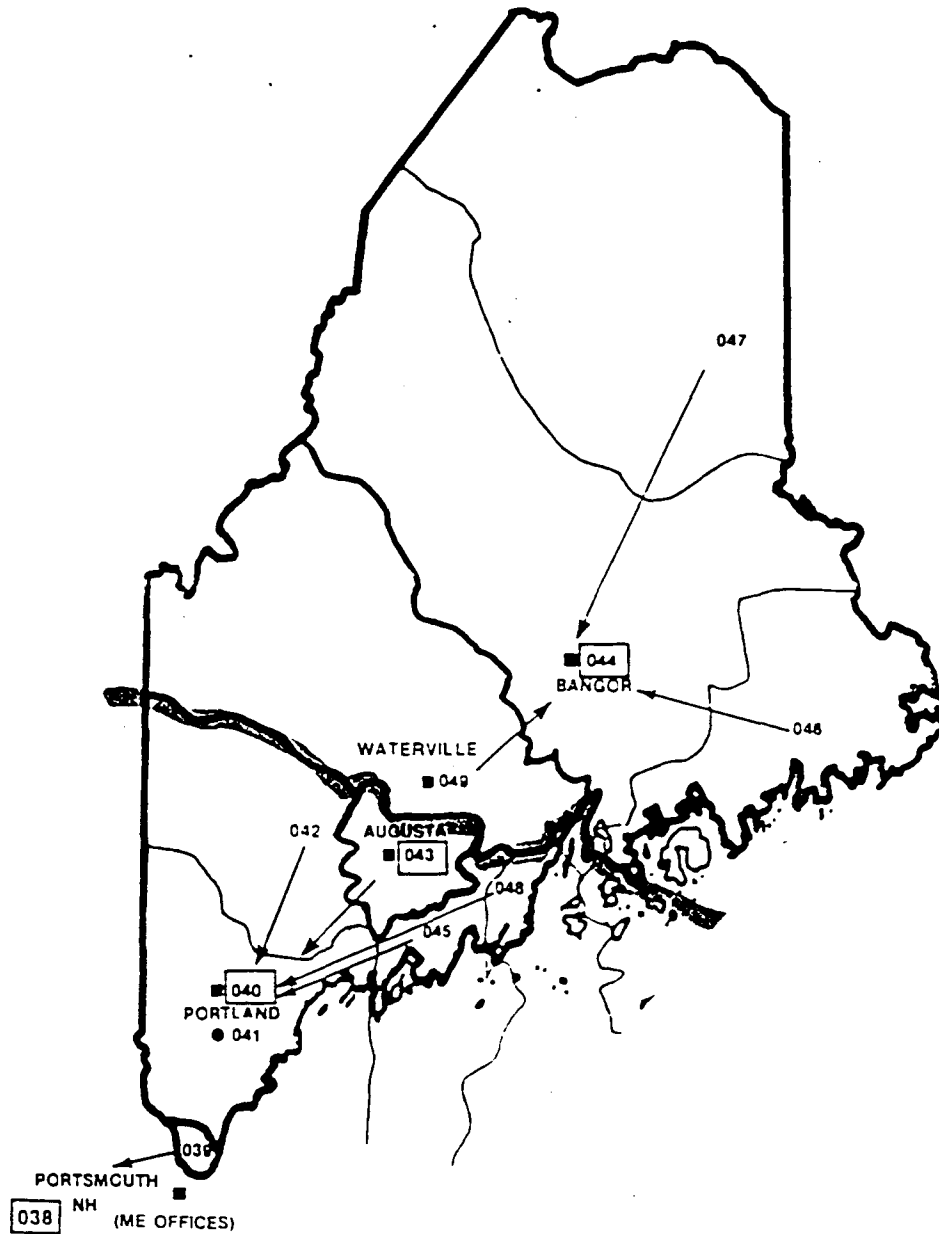

Survey participants were thus selected from those industry groups which could be expected to benefit from reduced transportation costs, were likely to have customer or supplier relationships in Canada or the Northeastern US, and were located in regions of the state that could be serviced by one or more of the conceptual east-west highway corridors. In addition, survey participants were limited to businesses of a sufficient size, measured by either employment or sales, to suggest that they shipped or received significant volumes of freight. Businesses that were either too small, or were engaged in activities that were not transportation dependent, were omitted from the survey effort.

Table 4-1: Regional and Industry Distribution of the Survey Sample

Industry	Total	Northern	Southern	% Distribution		Total
Distribution	Mailing List	Maine [1]	Maine [2]	No. ME	So. ME	Sample
Agr., forestry & fishing	139	98	41	18.4%	5.2%	10.5%

NOTES:						
	[1] Includes all 3-digit zips within Bangor & Waterville					
	Sectional Centers (See Map 4-1)					
	[2] Includes all 3-digit zips within Augusta and Portland					
	Sectional Centers (See Map 4-1)					

The distribution of the survey mailing list by industry group and region is presented in Table 4-1. To facilitate analysis of the data by region, survey recipients were sorted by three-digit postal zip codes. Postal zip codes designated as "northern" Maine, include those regions in which the majority of the conceptual east-west corridors are located. The "southern" Maine zip codes represent the balance of the state, generally including the Augusta region and points south and southwest. Map 4-1 shows the regional boundaries formed by the classification of the state's postal zip codes used for this analysis.

Map 4-1: Geographic Definition used to Distinguish Survey Responses Between "Southern" and "Northern" Maine

As shown in Table 4-1, more than half of the surveys were mailed to manufacturing firms, including a large sampling of paper and wood products manufacturers. Large wholesale and retail trade establishments received 25% of the surveys and 10% were mailed to agricultural businesses. Although only 6% of the sample was made up of transportation firms, more than 80 of Maine's most important trucking companies and warehousing and distribution centers were contacted. The balance of the surveys were mailed to selected service industries such as hospitals, utilities or other larger businesses that were assumed to be somewhat reliant on truck freight.

In total, just over 40% of the sample, more than 500 companies, were located in northern Maine while the balance of nearly 800 firms were located in the more heavily populated southern region. Although smaller in number, the northern Maine sample includes a higher percentage of all employers located in that region, than the southern Maine sample.

The questionnaires were mailed in early February of 1999, followed by reminder post cards approximately three weeks later. Both the survey mailers and reminder post cards were accompanied by messages from Governor King, who explained the purpose of the research and urged recipients to participate. The survey instrument itself was a self mailer with an attached postage pre-paid self mailing return.

The questionnaire used to solicit responses, including some raw data from the survey, appear in Appendix C. Summary observations drawn from our analysis of the survey results are presented below.

Characteristics of Survey Respondents

The distribution of survey returns from each region is profiled in Table 4-2. As shown, 152 responses were received, an 11.5% return on from the initial mailing list. Returns were equally distributed between the northern and southern regions, with 76 returns received from each.

Comparatively high response rates were obtained from the lumber and wood products industry in northern Maine (a 25% return), as well as that region's agricultural and transportation sectors (each representing a 17% response rate). "Other" manufacturing, representing all remaining sectors outside of the lumber, wood products and paper industries, also exhibited high return rates of 46% in the southern region and 18.4% in the northern part of the state. Wholesale and retail trade industries in both southern and northern Maine also responded in high percentages in the survey.

Table 4-2: Industry Distribution of Survey Respondents

Current Employment Levels

Among the survey respondents, 96 operated out of one location and 41 respondents were part of larger organizations. In total, these companies have more than 19,600 full-time employees, including more than 16,300 workers at the 152 Maine locations represented in the survey. Survey participants from northern Maine had more than 7,600 employees, just under 40% of the total, while southern Maine respondents employed nearly 12,000 workers.

No Response	9					

Although the total number of employees reported by survey participants is large, these companies together represent less than 3 percent of Maine's total employment, and their responses should be evaluated in that context. As stated previously, survey participants are also significantly larger than the typical Maine business, as indicated by the reported average of 140 employees per respondent. Northern Maine firms were smaller in terms of average employment (105 employees) than southern Maine firms (179 employees).

Responses to the remaining questions are summarized below. Detailed response tables are also provided in Appendix C.

Question 4 : Does your company currently have customers or suppliers in any of the following regions (listed in Table 4-4), to which you send or from whom you receive shipments at this location?

Respondents have significant numbers of customers and suppliers in regions that could be made more accessible by an east-west highway. More than 49% of respondents, statewide, have customers and/or suppliers in Atlantic Canada, 47% in Quebec, 26% in Ontario/Western Canada, 55% in northern NH/VT, 56% in Western NY and 60% in the

Midwest and Western US. In addition, 95% of the survey respondents had customers or suppliers located within Maine and 80% in Southern New England and the Mid-Atlantic States. *These percentages indicate that at least half of the statewide sample currently does business in regions that could be made more accessible to the interior Maine, via an east-west highway corridor.*

Table 4-4: Percent of Respondents with Customers or Suppliers, By Region

New England & Mid-Atlantic	57	89.1%	10.9%
Midwest US	46	70.3%	29.7%
Did Not Answer Question	12		

As could be expected, a slightly higher percentage of northern Maine businesses had customer or supplier relationships in Atlantic Canada (57% of all respondents) than southern Maine firms (40%). At the same time, a smaller percentage of Northern Maine respondents have customers and/or suppliers in Southern New England and the Middle Atlantic States (72%) and Midwest (52%), compared to southern Maine firms. There was relatively little northern/southern Maine variation in terms of the percentages of companies that did business with the other regions listed in the question.

Questions 5 and 9: How would you characterize your company's overall trends in sales to and purchased received from each of these regions over the past five years?

Respondents were also asked to characterize recent trends in sales to and purchases from the regions indicated in Table 4-5. Comparisons of numbers of firms reporting growing sales versus declining or flat sales, indicate that current "growth markets" for Maine firms are located in the Mid-Atlantic, Southern and Midwest US, as well as within Maine itself. As shown in Table 4-5, roughly 19% to 23% of all respondents answering the question, have recently experienced "growing" sales or exports to Atlantic Canada, Ontario and Quebec. Significantly larger percentages of respondents have experienced growing sales to other regions.

Table 4-5: Trends in Regional Trade Patterns of Survey Recipients

Trends in Sales to Regions	Total Responses	Description of Trends - All Respondents				Respondents with Sales		
		Growing	Declining	Stable/Flat	Does Not Apply	Growing	Declining	Stable/Flat

Did Not Answer Question	11							

The comparatively small percentage of Maine firms with growing Canadian sales, is obviously due in part to the fact that many firms did not have Canadian customers. To remove this influence, we have also calculated the percentages of firms reporting growing, declining and flat sales, only for those Maine firms with customers in each region. For respondents with Atlantic Canada customers, for example, slightly less than 38% characterized recent sales trends as "growing", while higher percentages of respondents characterized their sales to Quebec (45%) and Ontario (58%) as growing. By comparison, more than 70% of firms with customers in Southern NE, the Middle-Atlantic and Midwest US have recently experienced growing sales to those regions.

Among Maine companies with Canadian customers, the fact that more describe sales as "declining or flat" than growing, is perhaps a reflection of recent unfavorable exchange rates, as was indicated elsewhere in the survey. However, when asked to similarly characterize trends in purchases from these same regions, the ratios were fairly similar.

Questions 6 and 10: How likely is it that your company will increase shipments to or purchases from any of the following regions in the foreseeable future?

Table 4-6: Expected Future Regional Trade Patterns of Survey Respondents

Likelihood of Increasing Future Shipments (Sales) to...	Total Responses	% Indicating Somewhat to Highly Likely	% Indicating Somewhat to Highly Unlikely
Statewide Response			
Within Maine	132	71.2%	28.8%
Atlantic Canada	121	39.7%	60.3%
Quebec	124	41.9%	58.1%
Ontario	113	25.7%	74.3%

Did Not Answer Question	13		

Questions 6 and 10 asked respondents to comment on their near-term prospects of increasing sales and purchases to/from these same regions. The number of companies which expect to increase shipments (or sales) to these markets, generally follow recent trends. As shown, Maine firms are primarily looking to other US regions for sales growth. There is very little difference in expectations between southern and northern Maine companies on this issue.

In the short term, higher percentages of respondents expect to increase sales within Maine, to Southern New England and the Mid-Atlantic States, the Midwestern US, and Northern NH/VT, than to Canadian markets. Also, the percentage of firms that are unlikely to do more business in Canada, is much larger than the percentage of firms that expect to increase Canadian sales. However, the number of Maine firms that expect to increase sales to Atlantic Canada, Quebec and Ontario is slightly larger in each case, than the number of firms reporting growing sales to those regions over the past five years.

Roughly a third of all respondents appear to view these three Canadian regions as potentially growing markets.

When asked about expected purchases from these same regions, the ratios were almost identical to sales.

Questions 7 and 11: Please estimate the average monthly number of outbound and inbound shipments from this location, to customers located in Quebec/Ontario, Atlantic Canada, Northeast, Midwest & Western US markets (and points beyond), by the following transportation modes.

Table 4-7: Reported Average Monthly Outbound Shipments

Statewide, all survey respondents reported making an average of nearly 11,000 shipments per month (by all transportation modes), including 10,500 shipments by truck, to the four geographic regions listed in Table 4-7. Numbers of outbound truck shipments westbound to Ontario and Quebec, exceed eastbound shipments to Atlantic Canada by a factor of 2.3 to 1. Westbound shipments to Upstate NY, the Midwest and Western US also exceed the volumes headed for Ontario and Quebec. Respondents ship virtually no product to Canada and limited volumes westbound to US destinations, by rail. It is also interesting to note that total monthly shipments leaving northern Maine greatly exceed southern Maine. This appears to be consistent with the commodity flow data, which identified a high concentration of paper, pulp and wood products among the State's largest outbound commodities. These findings also suggest that improved

westbound highway access may be more important for freight traffic originating in Maine than eastbound access. The data also suggest that rail does not currently carry significant volumes of outbound freight to those regions that would be serviced by an east-west highway.

Inbound shipments are similarly profiled in Table 4-8. The reported numbers of monthly inbound shipments from Ontario/Quebec (550) and Atlantic Canada (493) are roughly comparable, but are fewer in number than reported inbound shipments from Upstate NY, the Midwest and Western US (797). Monthly inbound shipments from southern New England, the Mid-Atlantic and Southeastern US States (2,956) exceed the remaining three regions combined. The numbers of inbound shipments are also more evenly split between the northern and southern regions of the state.

Table 4-8: Estimated Average Monthly Inbound Shipments

Questions 8 and 12: If applicable, please list the three most frequent destinations of your outbound and inbound shipments (City, town, county or Canadian census division):

A list of most frequent locations of inbound/outbound shipments is provided in Appendix C.

Question 13: Please estimate the recent (past 3 to 5 years) annual growth or decline in your company's inbound and outbound shipments of finished product, raw materials or supplies to and from each of the following regions and for each transportation mode.

Respondents were asked to report their recent annual rates of growth or decline in shipments for various modes of transportation (truck, rail, ship and air) and regions of origin/destination. Due to the very limited number of firms that reported data for modes other than truck, the only analysis possible was for truck shipments. Table 4-9 shows the number of firms that reported growth rates of inbound/outbound truck shipments to each region. The table also shows the current aggregate number of monthly truck shipments reported by these same firms (See Question 11). Finally, we applied the reported growth rates by each respondent to the number of shipments currently received, to develop an average rate of growth for all firms reporting.

Table 4-9: Reported Growth in Inbound/Outbound Truck Shipments

Region	Number Firms Reporting	Existing Monthly Shipments		Avg Growth - All Repondents	
	Growth Rates	Outbound	Inbound	Outbound	Inbound
Ontario, Quebec & Western Canada	20	854	354	17.6%	46.2%
Atlantic Canada	24	778	489	31.8%	20.2%
Northern NH/VT, Upstate NY, Midwest & Western US	34	1,878	731	33.5%	15.2%
Southern NE, Mid-Atlantic & Southeastern US	29	6,022	2,820	39.9%	17.8%

As shown, the small number of firms that responded to this question are reporting substantial growth rates in shipments to/from all of the indicated regions. These results are somewhat inconsistent with the preceding questions and reflect the presence of very high percentage increases among a small sampling of firms. It is also possible that some respondents reported an aggregate percentage increase over the entire period, rather than an annualized growth rate as requested.

Question 14: If you currently ship or receive goods to/from any of the above regions by truck, please list the highway routes that are used most frequently by your company, your contracted carriers or your suppliers.

A list of most frequently used inbound/outbound transportation routes is provided in Appendix C.

Question 15: If you regularly send or receive goods by truck to or from the following regions, how often do your company, your suppliers or your contracted carriers encounter transportation-related problems in making or receiving timely and cost-effective deliveries?

The purpose of this question was to gain insight into the perceived reliability of Maine's existing highway system among those businesses which send or receive large volumes of truck freight. A minority of respondents reported experiencing "very frequent" or "frequent" problems in receiving truck deliveries from any region. However, the largest percentage of firms (more than 25%) reported encountering very frequent or frequent problems, when sending or receiving shipments to/from other locations within Central

and Northern Maine. The percentage of Maine companies that encounter transportation problems when shipping to/from Atlantic Canada (21%) or Quebec (22%), is also higher than the other regions listed. The smallest percentage of companies report encountering transportation problems, when shipping/receiving freight to or from Southern New England and points south (6.3%) and Upstate New York (9.5%).

Table 4-10: Reported Frequency of Transportation-Related Shipping Problems

	No. of Respondents with Shipments	% w/Frequent or Very Freq.	% Indicating Occasional	% Indicating Rarely or Never
Region	To/From Region	Problems	Problems

Midwest & Western US	34	2.9%	23.5%	73.5%
Did Not Answer Question	19			

As would be expected from the statewide response, a higher percentages of firms based in Northern Maine report experiencing very frequent or frequent transportation problems to/from all regions, than do respondents located in Southern Maine. *These responses indicate a need to improve the reliability of truck movements into, out of and through Central and Northern Maine.*

Question 16: Please refer to the map at the beginning of the survey and consider the locations of your business, your customers and suppliers in relation to the proposed East-West Highway Corridors. Based upon your expectations of potential travel time savings offered by each, please rate each corridor on a scale of 1 (minimal/low use) to 5 (high level of use), in terms of its likelihood of being used as a shipping route to or from your place of business ...

Table 4-11 shows the number of respondents who ranked each conceptual corridor on the basis of its likely level of use by that company and its suppliers. Scores were then aggregated and ranked. As shown, the reported average likelihood of use for the entire

statewide sample did not exceed 3 (the mid-point) for any corridor. Average scores ranged from 2.2 (Corridor A) to 2.74 (Corridor B).

Table 4-11: Corridor Rankings Based Upon Projected Levels of Use

	Likely Level of Usage					Don't Know	Total Score	Average Score
	Low 1	2	3	4	High 5			
Conceptual Corridor								
Statewide Sample								
Corridor A-Trans Maine Trail	53	7	14	5	16	32	209	2.20
Corridor B-Route 2-9 Upgrade	39	8	9	19	21	31	263	2.74
Corridor C-Route 9-27 Upgrade	40	12	15	16	15	29	248	2.53

Corridor E-Southern Route	27	5	7	5	5	15	103	2.10
Southern Maine Respondents								
Corridor A-Trans Maine Trail	27	4	5	1	3	22	69	1.73
Corridor B-Route 2-9 Upgrade	19	2	5	8	9	19	115	2.67
Corridor C-Route 9-27 Upgrade	21	4	7	5	5	20	95	2.26
Corridor D-Coburn Gore 4-Lane	19	4	8	4	4	18	87	2.23
Corridor E-Southern Route	14	1	4	13	8	17	120	3.00

When respondents are isolated by region, clearer preferences among the corridors tend to emerge. However, even Northern Maine respondents, composite scores for all Corridors were below 3. Among Northern Maine firms, the 4-lane Calais to Coburn Gore Corridor (D) ranked highest, by a slight margin over the Route 2 and Route 9 upgrade (Corridor B) from Calais to Gilead. Southern Maine firms indicated that they would be most likely to use the four-lane Corridor (E) linking Lewiston-Auburn to the NH Border at Gilead. It is also interesting to note that the incremental improvement of the Calais to Coburn Gore route from a 2-lane upgrade (Corridor C) to a four-lane highway (Corridor D), did not produce a large increase in the anticipated use of that corridor among either statewide or Northern Maine respondents.

The percentage distribution of the above rankings is also provided in Table 4-12. The difficulty in servicing a dispersed statewide sample of businesses through a single highway corridor is clearly evidenced in this table. The percentage of respondents ranking each Conceptual Corridor a "1" (low use), exceeded those indicating "5" (high use) in each case, even within the individual regions.

Table 4-12: Percentage Distribution of Corridor Rankings

Conceptual Corridor	Percent of Total Responses				
	1	2	3	4	5
Statewide Sample					
Corridor A-Trans Maine Trail	55.8%	7.4%	14.7%	5.3%	16.8%

Corridor E-Southern Route	35.0%	2.5%	10.0%	32.5%	20.0%

Question 17: Please rank the four corridors in terms of their greatest overall potential to be used by your company and suppliers (Rank 1 through 4, using 1 to indicate the Corridor which offers the greatest potential to be used.)

Table 4-13: Corridor Rankings

	Weighted	
Conceptual Corridor	Score	Rank
Statewide Sample		
Corridor A-Trans Maine Trail	259	5
Corridor B-Route 2-9 Upgrade	226	3
Corridor C-Route 9-27 Upgrade	222	1-2
Corridor D-Coburn Gore 4-Lane	222	1-2
Corridor E-Southern Route	234	4
Northern Maine		
Corridor A-Trans Maine Trail	122	3
Corridor B-Route 2-9 Upgrade	132	4
Corridor C-Route 9-27 Upgrade	108	1-2
Corridor D-Coburn Gore 4-Lane	108	1-2
Corridor E-Southern Route	149	5
Southern Maine		
Corridor A-Trans Maine Trail	137	5
Corridor B-Route 2-9 Upgrade	94	2
Corridor C-Route 9-27 Upgrade	114	3-4
Corridor D-Coburn Gore 4-Lane	114	3-4
Corridor E-Southern Route	85	1

The ranking of corridors A-D was very close, with weighted scores ranging less than 15% from first to last. Respondents asked to rank the Corridors, with 1 signifying first preference. Among all respondents, Corridors C & D ranked first with the same score, followed by B, E and A. Among those respondents located in Northern Maine, the order was similar, with Corridor A moving from 5 to 3. Southern Maine firms, favored Corridors E and B.

Question 18: In your opinion, what is the likelihood that your preferred corridor would provide the following benefits to your company....?

Significant percentages of respondents indicated that their preferred Corridor could provide a range of economic benefits to their companies. The following table profiles the percentage of respondents who indicated that their preferred Corridor would be either "highly likely" or "likely" to provide a list of potential benefits, versus those who expressed the opposite view.

Table 4-14: Percentage of Respondents Perceiving Benefits from their "Preferred East-West Corridor

Project Benefit	Total Responses	% of Total Respondents	
		Indicating Highly Likely or Likely	Indicating Highly Unlikely or Unlikely
Statewide Sample			
Lower costs of shipping/receiving goods in Maine	119	38.7%	35.3%
Lower shipping costs to/from Canada & the Midwest	115	35.7%	45.2%
Increase your firm's business in US & Canadian Markets	115	25.2%	47.0%
Improve your firm's cost-competitiveness	117	35.9%	39.3%
Improve the ability of commuting workers to access your facility	118	21.2%	62.7%
Did Not Answer Question	32		

As shown, nearly 39% of respondents statewide believe that their preferred corridor would be highly likely or likely to lower their firms' shipping costs within Maine, compared to a slightly smaller portion of the sample (35%) who did not expect a lowering of shipping costs. When asked if the highway would increase the firms' cost competitiveness, these percentages were reversed. Smaller percentages of companies believe that their preferred corridors would help them do more business with Canada, and fewer still believed that their preferred routes would facilitate commuting for employees.

Obviously, the percentage of respondents that might actually derive economic benefits from a single east-west highway corridor through Maine, would be much smaller than indicated in Table 4-14. Table 4-15 further refines this question by first isolating the Conceptual Corridor that each respondent "preferred" by ranking 1 or 2 on Question 17. The table then shows the number of respondents who indicated that they would be "highly likely" or "likely" to derive economic benefits from that particular corridor, and the percent of the total survey sample represented by that number.

Table 4-15: Distribution of Positive Economic Impacts for Each Corridor

Respondents Indicating Highly Likely or Likely	Corridor Ranked Most Likely to be used					% of Total Respondents				
	A	B	C	D	E	A	B	C	D	E
Lower costs of shipping/receiving goods in ME	15	19	21	25	22	9.9%	12.5%	13.8%	16.4%	14.5%
Lower shipping costs to/from Canada & the Midwest	14	17	17	20	16	9.2%	11.2%	11.2%	13.2%	10.5%
Increase your firm's business in US & Canadian Markets	9	13	15	17	11	5.9%	8.6%	9.9%	11.2%	7.2%
Improve your firm's cost-competitiveness	16	19	23	24	18	10.5%	12.5%	15.1%	15.8%	11.8%
Improve the ability of commuting workers to access your facility	10	11	13	13	9	6.6%	7.2%	8.6%	8.6%	5.9%

For example, among survey respondents who ranked the 4-lane Calais to Coburn Gore Corridor (D) either first or second as their "preferred" corridor, 25 also indicated that this "preferred" corridor would be highly likely or likely to lower their shipping costs within Maine. From this response, one could conclude that Corridor D could be expected to lower shipping costs for about 16% of all the survey respondents. Among the remaining corridors, responses to the same question ranged from 9.9% (Corridor A) to 14.5% (Corridor E). As shown, Corridor D benefitted the largest number of companies in all categories. From this analysis, one can conclude that for the range of economic benefits listed, a single east-west highway corridor through Maine would, at best, serve roughly 9 to 16 percent of the 150+ companies who participated.

Question 19: Based on your preceding responses, what do you believe is the likelihood that your company will undertake the following actions in the future, if (your preferred) East-West Highway is built...

Participants were asked to respond to a range of potential actions they might undertake in response to the construction of their "preferred" east-west highway corridor. Table 4-16, shows responses to a scenario in which respondents asked to assume that their preferred corridor provided the "maximum" travel time savings indicated in the survey instrument.

Table 4-16: Range of Potential Responses to Highway Construction

		% of Total Respondents	
		Indicating	Indicating
	Total	Highly Likely	Highly Unlikely
Potential Actions	Responses	or Likely	or Unlikely
Statewide Sample			
Expand at this location	118	22.9%	47.5%
Expand elsewhere in Maine	118	12.1%	72.4%
Relocate w/in ME closer to Highway	118	1.8%	88.5%
Expand in Canada	118	6.2%	81.4%
Expand elsewhere in the US	118	2.7%	83.2%
Relocate out of State	118	0.0%	92.9%

Southern Maine			
Expand at this location	54	20.4%	51.9%
Expand elsewhere in Maine	54	10.9%	70.9%
Relocate w/in ME closer to Highway	54	1.9%	87.0%
Expand in Canada	54	5.7%	84.9%
Expand elsewhere in the US	54	5.6%	81.5%
Relocate out of State	54	0.0%	92.6%
Did Not Answer Question	22		

Under this "best case" scenario, just under 23% of respondents, indicated that they would be "highly likely" or "likely" to expand operations at their existing facilities. The

potential of a new highway to induce movement of existing firms around the state appears to be minimal, as less than 2% indicated that they might move closer to a new highway. About 12% thought that they might expand at another location within the state, 6.2% might expand in Canada and less than 3% might expand elsewhere in the US.

Once again, these percentages reflect the collective responses to all of the preferred Conceptual Corridors. When results are isolated to a single specific corridor, the percentage of respondents who are likely to expand or relocate is greatly reduced.

Question 20: Based on your preceding responses, what do you believe is the likelihood that your company would undertake the following actions in the future, absent of any significant improvement to existing east-west transportation routes within the State of Maine?

The objective of question 20 was to determine whether a future "failure" to improve east-west transportation routes might have negative consequences in terms of discouraging companies from expanding or forcing them out of state. As shown, very little negative response was reported to result from inaction. In fact, more than 24% of respondents indicated that they will be "highly likely or likely" to expand at their current locations, absent of the highway's construction. This percentage was slightly higher than the response to the preceding question, which assumed the existence of a new highway.

Compared to the previous question, a slightly smaller percentage of firms would be likely to expand elsewhere in Maine if no highway improvements were made, fewer firms indicated that they would be likely to expand in Canada, absent of an east-west highway, but more may decide to expand elsewhere in the US. From the current perspective of Maine businesses who responded to this survey, east-west transportation issues do not appear to be an important influence on future expansion decisions. There is also no significant regional variation of opinion on this issue.

Table 4-17: Potential Response - Absent of Highway Construction

		% of Total Respondents	
		Indicating	Indicating
	Total	Highly Likely	Highly Unlikely
Potential Actions	Responses	or Likely	or Unlikely
Statewide Sample			
Expand at this location	119	24.6%	44.1%

Expand elsewhere in the US	119	7.0%	77.4%
Relocate out of State	119	0.9%	89.6%
Did Not Answer Question	33		

Question 21: Recognizing that the proposed East-West Highway will carry significant construction costs, and that higher costs will be incurred to achieve increased levels of improvement, where do you believe the project should rank in terms of priority, among the range of transportation investments which may be undertaken in Maine over the next 20 years?

Statewide, a minority of respondents with an opinion on the issue, ranked the east-west highway as either a "highest" or high" priority over the next 20 years, with the 4-lane

Corridors (35%) ranking lower among respondents than a 2-lane improvement (43.2%). Significant numbers also ranked either option as either "low or not a priority", 31.5% for the 2-lane and 43.5% for the 4-lane corridors.

Table 4-18: Ranking of an East-West Highway Among Statewide Transportation Priorities

East-West Highway Priority Level	Two-Lane Corridors			Four-Lane Corridors		
	Statewide Sample	Northern Maine	Southern Maine	Statewide Sample	Northern Maine	Southern Maine
Highest Priority	27	20	7	22	16	6
High Priority	21	12	9	19	9	10
Somewhat of a Priority	28	14	14	25	12	13

Totals:	152	76	76	152	76	76
Percent Distribution of Respondents with Opinions						
Highest Priority	24.3%	32.8%	14.0%	18.8%	25.4%	11.1%
High Priority	18.9%	19.7%	18.0%	16.2%	14.3%	18.5%
Somewhat of a Priority	25.2%	23.0%	28.0%	21.4%	19.0%	24.1%
Low Priority	14.4%	13.1%	16.0%	17.9%	19.0%	16.7%
Not a Priority	17.1%	11.5%	24.0%	25.6%	22.2%	29.6%
Totals:	100.0%	100.0%	100.0%	100.0%	100.0%	100.0%

Regional differences of opinion are more apparent on this issue than some of the other survey questions. Among Northern Maine businesses, a majority (52.5%) rank the two-lane Corridors as either a highest or high priority, compared to only 24.6% who hold the opposite view. It is interesting to note that the four-lane Corridors rank lower than the two-lane even among northern Maine firms, with only 39.7% characterizing them as a highest or high priority, compared to 41% who characterized them as a low priority or not a priority.

The remaining survey questions primarily addressed issues related to US/Canada trade issues, tolling issues and shipping costs. Findings from these questions have been analyzed in less detail and are summarized below.

Question 22: Over the past 10 years, tariffs on most trade between the US and Canada have been eliminated as part of the US-Canada and North America Free Trade Agreements. Has the reduction in tariffs allowed you to expand business (either purchases or sales) in Canada?

Roughly 28% of the survey respondents who answered this question, indicated that they had expanded trade with Canada as a result of tariff reductions. More than half (54%) said no and the balance did not know or had no opinion. A higher percentage of respondents, nearly 35%, expected that these trade agreements would their interest in doing more business with Canada in the future. These responses are slightly lower than the overall percentage of firms who indicated that they currently do business in Canada.

Question 23: On a scale of 1 (not important) to 5 (very important), how would you rate the following factors in terms of their importance as an impediment to your company's current ability to increase business (either purchases or sales) with Canada?

Respondents were asked to rate ten listed impediments to increased Canadian trade in order of importance from 1 (none) to 5 (high). Among those, regulations/red tape ranked highest (3.46), followed by exchange rates (3.44) and competition from other US & Canadian firms (3.30). Among other factors that ranked above 3.0, "shipping costs" ranked 4th (3.24) followed by Canadian economic conditions (3.19), and border crossing/Canadian Customs (3.09). The quality of "highway access" to Canada scored 3.04, 7th among the ten issues listed. From these responses, it is apparent that from the current perspective of Maine businesses, economic and regulatory issues are a greater impediment to increased trade with Canada than are issues of transportation cost and access.

Question 24: Please indicate and rank by order of importance the three primary impediments to your company's ability or desire to establish or expand business operations in Canada. (Feel free to cite other factors not listed above.)

A list of all impediments listed by survey respondents appears in Appendix C.

Questions 25 and 26: On a scale of 1 (not an issue) to 5 (a major issue), are the following factors currently an issue with your company, in terms of their impact on the volume of trade you do with Canada? To what extent could they become an issue in the future if the proposed east-west highway is built?

Respondents were asked to rate 4 specific issues on a scale of 1 (not an issue) to 5 (major issue), in terms of their perceived importance, currently and in the future, as impediments to Canadian trade. The intent of the question was to determine whether other potential transportation issues, in addition to the quality of highways, could impact US/Canada trade. The issues listed were cost of tolls, cost of fuel, border crossing congestion and differential US/Canadian truck weights.

Because a only a third of respondents appeared to have an interest in Canada trade, it is not surprising that no issue scored above 3 (current or future). Congestion/delays at border crossings generated most concern both as a current (2.30) and future (2.61) issue. Cost of tolls showed the greatest jump in concern rising from a score of 1.58 currently to 2.45 as a future concern. (This perhaps reflects a concern that an east-west highway could be heavily tolled.) Cost of fuel rose from 2.12 (current) to 2.33 (future) and differential US/Canadian Truck weights rose from 2.07 (current) to 2.35 (future). Not surprisingly, the lower permitted truck weights on US interstates compared to Provincial highways, is more of a concern to Canadian firms than Maine businesses.

Question 27: If all or portions of the East-West Highway are tolled at the following average costs per mile, how would those toll costs influence your company's usage of the highway. Assume that these toll rates apply to a five-axle tractor trailer traveling on a 4-lane divided highway. Also assume that toll rates applied to other classes of commercial vehicles will be proportionally similar to existing toll highways.

Table 4-19: Potential Impact of Tolling on East-West Highway Truck Use

	Reduction in Travel/Use at Average Toll/Mile				
	No		Very	Will Not	Don't
Average Toll Rate	Change	Somewhat	Likely	Use	Know
< \$0.10/Mile	38	19	8	8	49
\$0.10 - \$0.15/Mile	19	26	15	13	49
\$0.16 - \$0.20/Mile	12	14	18	27	51
\$0.21 - \$0.30/Mile	7	9	13	40	53
\$0.31 - \$0.40/Mile	7	5	12	45	52
>\$0.40/Mile	7	4	7	49	54
Did Not Answer Question	27				
% Distribution/Respondents with Opinion					
< \$0.10/Mile	52.1%	26.0%	11.0%	11.0%	
\$0.10 - \$0.15/Mile	26.0%	35.6%	20.5%	17.8%	
\$0.16 - \$0.20/Mile	16.9%	19.7%	25.4%	38.0%	
\$0.21 - \$0.30/Mile	10.1%	13.0%	18.8%	58.0%	
\$0.31 - \$0.40/Mile	10.1%	7.2%	17.4%	65.2%	
>\$0.40/Mile	10.4%	6.0%	10.4%	73.1%	

Participants were asked how various hypothetical toll rates (applied to five axle tractor trailer vehicles) might impact their company's use of an east-west highway. As shown, a large number of respondents either did not answer this question or responded "don't know". Among persons with opinions, more than half indicated that toll rates of less than 10¢ per mile would not influence their usage of the highway, compared to only 22% who would be "very likely" to reduce travel or "would not use" a tolled highway. However, substantial resistance to tolls is indicated at higher rates among those persons with an opinion. At an average toll rate of 16¢-20¢ per mile, the combined percentage of respondents with opinions who would be "very likely" to reduce travel or "would not use" the highway, rises to nearly 64%. At average toll rates above 20¢ per mile, the majority of respondents with opinions would not use the highway.

Remaining Survey Questions

Responses to questions 28 and 29 related to average shipping costs per ton for truck freight and the distribution of truck freight by types of carriers used. The number of responses received were insufficient to return usable data. Raw totals are provided in Appendix C.

Survey Comments

Comments reported by survey respondents are listed verbatim in Appendix C of this report.

Summary Conclusions

As indicated above, this survey effort returned data from a significant sample of Maine's largest companies. The survey returned an equal number of responses from both northern and southern regions of the state and included representation among several industry groups. Highlights include the following:

- The survey effort specifically targeted companies that would be most likely to have an interest in the proposed east-west highway. The survey was administered to a cross-section of the State's largest companies, in those industries which are most sensitive to transportation issues. In total, just over 40% of the sample, more than 500

companies, were are located in northern Maine while the balance of nearly 800 firms were located in the more heavily populated southern region.

- ▶ **A well-represented cross section of responses was received, both geographically and among industry groups.** More than 150 responses were received, an 11.5% return on from the initial mailing list. Returns were equally distributed between the northern and southern regions, with 76 returns received from each. In total, these companies have more than 19,600 full-time employees, including more than 16,300 workers at the locations represented in the survey.
- ▶ **Survey respondent already have significant numbers of customers and suppliers in regions that could be made more accessible by an east-west highway.** More than 49% of respondents, statewide, have customers and/or suppliers in Atlantic Canada, 47% in Quebec, 26% in Ontario/Western Canada, 55% in northern NH/VT, 56% in Western NY and 60% in the Midwest and Western US. These percentages indicate that at least half of the statewide sample currently does business in regions that could be made more accessible to the interior Maine, via an east-west highway corridor.
- ▶ **More Maine firms characterize their markets to the south and west as “growing” than Canadian markets.** For respondents with Atlantic Canada customers, less than 38% characterized recent sales trends as “growing”, while higher percentages of respondents characterized their sales to Quebec (45%) and Ontario (58%) as growing. By comparison, more than 70% of firms with customers in Southern NE, the Middle-Atlantic and Midwest US have recently experienced growing sales to those regions. Among Maine companies with Canadian customers, the fact that more describe sales as “declining or flat” than growing, is perhaps a reflection of recent unfavorable exchange rates, as was indicated elsewhere in the survey.
- ▶ **Roughly a third of all respondents appear to view Canada as a potential growth market in the future.** Maine firms are primarily looking to other US regions for sales growth. In the short term, higher percentages of respondents expect to increase sales within Maine, to Southern New England and the Mid-Atlantic States, the Midwestern US, and Northern NH/VT, than to Canadian markets. Also, the percentage of Maine firms that are unlikely to do more business in Canada, is much larger than the percentage of firms that expect to increase Canadian sales. There is very little difference in expectations between southern and northern Maine companies on this issue.
- ▶ **The survey findings suggest that improved westbound highway access may be more important for freight traffic originating in Maine than eastbound access.** Numbers of outbound truck shipments westbound to Ontario and Quebec, exceed eastbound shipments to Atlantic Canada by a factor of 2.3 to 1. Westbound shipments to Upstate NY, the Midwest and Western US also exceed the volumes headed for Ontario and Quebec. It is also interesting to note that total monthly shipments leaving northern Maine greatly exceed southern Maine.
- ▶ **Rail does not currently carry significant volumes of outbound freight to those regions that would be serviced by an east-west highway.** Respondents ship virtually no product to Canada and limited volumes westbound to US destinations, by rail.
- ▶ **Although a minority of Maine firms appear to encounter problems when shipping or receiving goods to/from the regions listed in the survey, problems are significantly greater in those areas which could be improved by an east-west**

highway. The largest percentage of firms (more than 25%) reported encountering very frequent or frequent problems, when sending or receiving shipments to/from other locations within Central and Northern Maine. The percentage of Maine companies that encounter transportation problems when shipping to/from Atlantic Canada (21%) or Quebec (22%), is also higher than the other regions listed. The smallest percentage of companies report encountering transportation problems, when shipping/receiving freight to or from Southern New England and points south (6.3%) and Upstate New York (9.5%).

- ▶ No single east-west corridor clearly emerges as a preferred alternative among survey respondents. When respondents were asked to rank each conceptual corridor on the basis of its likely level of use by that company and its suppliers, the reported average for the entire statewide sample did not exceed 3 (the mid-point) for any corridor. Even Northern Maine respondents, composite scores for all Corridors were also below 3. The percentage of respondents ranking each Conceptual Corridor a "1" (low use), exceeded those indicating "5" (high use) in each case, even when responses were isolated for northern and southern Maine.
- ▶ As could be expected there are regional differences in projected levels of use and "preference" among the five Corridors. Among Northern Maine firms, the 4-lane Calais to Coburn Gore Corridor (D) ranked highest, by a slight margin over the Route 2 and Route 9 upgrade (Corridor B) from Calais to Gilead. Southern Maine firms indicated that they would be most likely to use the four-lane Corridor (E) linking Lewiston-Auburn to the NH Border at Gilead. It is also interesting to note that the incremental improvement of the Calais to Coburn Gore route from a 2-lane upgrade (Corridor C) to a four-lane highway (Corridor D), did not produce a large increase in the anticipated use of that route, among either statewide or Northern Maine respondents. When asked to rank the Corridors, with 1 signifying first preference, among all respondents statewide, Corridors C & D ranked first with the same score, followed by B, E and A. Among respondents located in Northern Maine, the order was similar, with Corridor A moving from 5 to 3. Southern Maine firms, ranked Corridors E and B one and two.
- ▶ When presented with a list of possible economic benefits that might arise from the construction of their "preferred" east-west highway corridor, about 20% to 40% of the respondents actually expected their companies to benefit. Nearly 39% of respondents statewide believe that their preferred corridor would be "highly likely" or "likely" to lower their firms' shipping costs within Maine, compared to a slightly smaller portion of the sample (35%) who did not expect a lowering of shipping costs. When asked if the highway would increase the firms' cost competitiveness, these percentages were reversed. A smaller percentage of companies (25%) believe that their preferred corridors would help them do more business with Canada, and fewer still (21%) believed that their preferred routes would facilitate commuting for employees. Because of the geographic dispersion of survey respondents, the maximum percentage of firms that are likely to derive economic benefits from any single Conceptual Corridor reduces these reported ratios by more than half.
- ▶ An east-west highway is not likely to cause a significant movement of firms within the State. Just under 23% of respondents, indicated that they would be "highly likely" or "likely" to expand operations at their existing facilities if their "preferred" east west corridor was built. The potential of a new highway to induce movement of existing firms around the state appears to be minimal, as less than 2%

indicated that they might move closer to a new highway. About 12% thought that they might expand at another location within the state, 6.2% might expand in Canada and less than 3% might expand elsewhere in the US.

- ▶ From the current perspective of Maine businesses who responded to this survey, the State's failure to improve east-west transportation routes would not appear to have a negative influence on future expansion decisions. More than 24% of respondents indicated that they will be "highly likely or likely" to expand at their current locations, absent of the highway's construction. This percentage was slightly higher than the response to the preceding question, which assumed the existence of a new highway. A slightly smaller percentage of firms indicated that they would be likely to expand elsewhere in Maine if no highway improvements were made, fewer firms indicated that they would be likely to expand in Canada, absent of an east-west highway, but more may decide to expand elsewhere in the US.
- ▶ Survey respondents are split concerning where an east-west highway should rank as a priority among other transportation needs over the next 20 years. Statewide, a minority of respondents with an opinion on the issue, ranked the east-west highway as either a "highest" or high" priority over the next 20 years, with the 4-lane Corridors (35%) ranking lower among respondents than a 2-lane improvement (43.2%). Significant numbers also ranked either option as either "low or not a priority", 31.5% for the 2-lane and 43.5% for the 4-lane corridors. Among Northern Maine businesses, a majority (52.5%) rank the two-lane Corridors as either a highest or high priority, compared to only 24.6% who hold the opposite view. It is interesting to note that the four-lane Corridors rank lower than the two-lane even among northern Maine firms, with only 39.7% characterizing them as a highest or high priority, compared to 41% who characterized them as a low priority or not a priority.
- ▶ Among impediments to increased Canada trade faced by Maine companies, transportation issues rank lower than economic and regulatory issues. Respondents were asked to rate ten listed impediments to increased Canadian trade in order of importance from 1 (none) to 5 (high). Among those, regulations/red tape ranked highest (3.46), followed by exchange rates (3.44) and competition from other US & Canadian firms (3.30). Among other factors that ranked above 3.0, "shipping costs" ranked 4th (3.24) followed by Canadian economic conditions (3.19), and border crossing/Canadian Customs (3.09). The quality of "highway access" to Canada scored 3.04, 7th among the ten issues listed.
- ▶ Respondents would accept limited tolling of an east-west highway. Among persons with opinions, more than half indicated that toll rates of less than 10¢ per mile would not negatively influence their usage of the highway. However, substantial resistance to tolls is indicated at higher rates among those persons with an opinion. At an average toll rate of 16¢-20¢ per mile, the combined percentage of respondents with opinions who would be "very likely" to reduce travel or "would not use" the highway, rises to nearly 64%. At average toll rates above 20¢ per mile, the majority of respondents with opinions would not use the highway.

V

Appendices

Appendix A: Illustrative Verbatim Comments-Survey of Tourism Leaders

"There are no difficulties in getting to our site. It takes Canadians 5-6 hours to get here but that is not a problem."

"Maine is a bottleneck. The Canadians have a good highway on their side then it just falls apart on the Maine side."

"(I) do not want it to come through here - would prefer it to stay lower. (The highway) would detract from the wilderness experience of this area."

"Don't just build a road. Saleability is a big issue. (We) need to know why it is going where it is going."

"Need to balance opening up the north and keeping it close to the existing growth."

"Could potentially hurt us if it goes up north of Bethel into Canada (Coburn Gore). This would push business out of the country into Canada."

"Needs to be set up like a feeder - like the pipeline. The pipeline has specific points it needs to hit. The highway has to be an economic feeder."

"(The east-west highway) won't benefit anything north of Lincoln."

"Areas like this are remote and we want to keep it that way but at the same time everyone wants access. The places that are not going to have any easier access because the highway will not touch their areas will have to do more marketing to promote their areas and convince people that it is worth their while to come the distance. Right now they are all hard to get to so they stand together. When one area becomes easier to get to, the others will have to market to get people to come the distance."

"Would the volume of traffic be too much for this area?"

"No negatives (about the proposed east-west highway) unless someone is opposed to growth, opposed to tourism, and opposed to economic growth."

"The highway would allow visitors to combine trips. Instead of deciding whether to go to Niagara Falls or the Maine Coast, visitors would be more likely to combine the two trips into one. Visitors would be more likely to group vacation spots with the addition of an east-west highway in the state of Maine."

"The roads will not stop people from visiting. If people don't want to be on the roads with loggers then they shouldn't be coming to Maine. The question is 'how fast do we want people to go through the state?' If they go slow they can actually see the state."

"It is national transportation to go through NH and VT or up through Canada through Coburn Gore to connect the largest populations - New Brunswick/ Nova Scotia and Montreal/ Ontario."

"Maine is more isolated than it needs to be. Isolated due to positioning, political boundaries and infrastructure."

"It is not easy to go east to west in this state."

"We will be happier/better off with the highway but it will change the movement of the state."

"People here are nervous about it because they feel it will take tourists off Rte. 1."

"The highway would put us in the middle of something instead of always being at the end."

"May move people too fast. People won't enjoy the slower pace of Maine. Don't want to become Anytown USA."

EAST-WEST HIGHWAY QUESTIONNAIRE

AREA: _____ (6-7)

Hi, my name is _____, and I'm calling from Davidson-Peterson Associates, a market research firm in southern Maine. We are conducting a brief survey about travel within Canada and the State of Maine. I assure you that we are not trying to sell you anything. Your opinions are very valuable to us. May I speak to either the female or male head of this household?

1. Are you 18 years or older?

(8) Yes [] - 1 -->CONTINUE

No [] - 2 -->ASK TO SPEAK TO SOMEONE WHO IS; IF AN ADULT IS NOT AVAILABLE, THANK PERSON AND TERMINATE CALL

I'd like to ask you a few questions about car or RV trips you may have taken in the past two years to other parts of Canada or to Maine.

2. In the past two years - 1997 and 1998, how many car or RV trips did you take either *to* the State of Maine or *through* Maine on your way to other states or provinces?

 (9-11) --> IF "0", SKIP TO QUESTION 6

3. On how many of these trips, if any, did you specifically travel *to visit sites in Maine*?

 (12-14) -->IF "0", SKIP TO QUESTION 4

a. In which months in 1998 did you travel by car or RV to visit sites in Maine? How about in 1997?
 [PLEASE LIST UP TO SIX MONTHS MENTIONED BY RESPONDENT]

For each month mentioned, please ask respondent the following questions:

- b. Was this trip to Maine for business or pleasure?
- c. Including yourself, how many people traveled in your car or RV on this trip to Maine?
- d. How many nights did you stay in Maine on this trip?
- e. What place in Maine was your primary destination?

MONTH/YEAR (3a)	BUSINESS OR PLEASURE (3b) Business(1) Pleasure(2) Both(3)			# OF PEOPLE (3c)	# OF NIGHTS (3d)	PRIMARY DESTINATION (3e)
(15-18)	[] - 1	[] - 2	[] - 3 (39)	(45-46)	(57-58)	(69-7
(19-22)	[] - 1	[] - 2	[] - 3 (40)	(47-48)	(59-60)	(71-7
(23-26)	[] - 1	[] - 2	[] - 3 (41)	(49-50)	(61-62)	(73-7
(27-30)	[] - 1	[] - 2	[] - 3 (42)	(51-52)	(63-64)	(75-7
(31-34)	[] - 1	[] - 2	[] - 3 (43)	(53-54)	(65-66)	(77-7
(35-38)	[] - 1	[] - 2	[] - 3 (44)	(55-56)	(67-68)	(79-8

4. On how many car or RV trips in 1997 and 1998, if any, did you travel *through* Maine on your way to other states or provinces?

-->IF "0", SKIP TO QUESTION 5

(6-8)

- a. In which months in 1998 did you travel by car or RV *through* Maine? How about in 1997? [PLEASE LIST UP TO SIX MONTHS MENTIONED BY RESPONDENT]

(29-32)	[] - 1	[] - 2	[] - 3 (38)	(49-50)	(61-62)	(73-74)

5. What route(s) do you generally use in traveling to or through Maine? [PROBE FOR SPECIFIC ROUTES USED]

_____[75/76 -]
 _____[77/78 -]
 _____[79/80 -]

6. In 1999, how many car or RV trips, if any, do you plan to take to sites in the State of Maine?

(6-8)

7. If highway improvements were made which would reduce the driving time *to Bangor, Maine* by up to 30 minutes, how would this impact the number of trips you would take to Maine? Would you take *more, fewer, or the same number of trips* to Maine?

- (9) More [] - 1 -->How many **more** trips would you expect to take in 1999?
 Same [] - 2
 Fewer [] - 3 -->How many **fewer** trips would you expect to take in 1999?

(10-12)

(13-15)

8. In 1999, how many trips, if any, do you plan to take to the Maritime provinces in Canada?

(16-18)

9. In 1999, how many trips, if any, do you plan to take to the Maritime provinces in Canada using routes which run through Maine?

9a. If highway improvements were made which would reduce the driving time *through Maine to the Maritime Provinces* by up to 1 hour, how would this impact the number of trips you would take through Maine on your way to Canada? Would you take *more, fewer, or the same number of trips* through Maine?

(22) More ☐ - 1 -->How many **more** trips would you expect to take in 1999? _____
 Same ☐ - 2 (23-25)
 Fewer ☐ - 3 -->How many **fewer** trips would you expect to take in 1999? _____
 (26-28)

10. In 1999, how many trips, if any, do you plan to take to the Maritime provinces in Canada using the Trans Canada highway? _____
 (29-31)

10a. If highway improvements were made which would reduce the driving time *through Maine to the Maritime Provinces* by up to 1 hour compared to the Trans Canada highway, how would this impact the number of trips you would take through Maine on your way to Canada? Would you take *more, fewer, or the same number of trips* through Maine?

(32) More ☐ - 1 -->How many **more** trips would you expect to take in 1999? _____
 Same ☐ - 2 (33-35)
 Fewer ☐ - 3 -->How many **fewer** trips would you expect to take in 1999? _____
 (36-38)

CLASSIFICATION

11. Into which of the following categories does your age fall? [READ CHOICES]

(39)	18-24 <input type="checkbox"/> - 1	55-64 <input type="checkbox"/> - 5
	25-34 <input type="checkbox"/> - 2	65 or older <input type="checkbox"/> - 6
	35-44 <input type="checkbox"/> - 3	Refused [DO NOT READ] <input type="checkbox"/> - 7
	45-54 <input type="checkbox"/> - 4	

12. What is the highest level of education you have completed?

(40)	Primary school <input type="checkbox"/> - 1	Four-year college degree <input type="checkbox"/> - 5
	Some high-school <input type="checkbox"/> - 2	Post-graduate work <input type="checkbox"/> - 6
	High-school graduate <input type="checkbox"/> - 3	Refused [DO NOT READ] <input type="checkbox"/> - 7
	Two-year college/ vocational/technical school <input type="checkbox"/> - 4	

13. GENDER OF RESPONDENT

(41) Male ☐ - 1
 Female ☐ - 2

Those are all of my questions. Thank you very much for your time.

EAST-WEST HIGHWAY QUESTIONNAIRE

AREA: _____ (6-7)

Hi, my name is _____, and I'm calling from Davidson-Peterson Associates, a market research firm in southern Maine. We are conducting a brief survey about travel within Canada and the State of Maine. I assure you that we are not trying to sell you anything. Your opinions are very valuable to us. May I speak to either the female or male head of this household?

1. Are you 18 years or older?

(8) Yes [] - 1 -->CONTINUE

No [] - 2 -->ASK TO SPEAK TO SOMEONE WHO IS; IF AN ADULT IS NOT AVAILABLE, THANK PERSON AND TERMINATE CALL

I'd like to ask you a few questions about car or RV trips you may have taken in the past two years to Maine or to the Maritime provinces in Canada.

2. In the past two years - 1997 and 1998, how many car or RV trips did you take either *to* the State of Maine or *through* Maine on your way to the Maritime provinces in Canada?

--> IF "0", SKIP TO QUESTION 6

(9-11)

3. On how many of these trips, if any, did you specifically travel *to visit sites in Maine*?

-->IF "0", SKIP TO QUESTION 4

(12-14)

a. In which months in 1998 did you travel by car or RV to visit sites in Maine? How about in 1997?
[PLEASE LIST UP TO SIX MONTHS MENTIONED BY RESPONDENT]

For each month mentioned, please ask respondent the following questions:

- b. Was this trip to Maine for business or pleasure?
- c. Including yourself, how many people traveled in your car or RV on this trip to Maine?
- d. How many nights did you stay in Maine on this trip?
- e. What place in Maine was your primary destination?

QUESTION 7

If highway improvements were made which would reduce the driving time to _____ by _____, how would this impact the number of trips you would take to Maine? Would you take more, fewer, or the same number of trips to Maine?

Montreal, New Brunswick, Nova Scotia, Toronto

- ...to Bangor, Maine by 45 minutes

Quebec

- ...to Bangor, Maine by up to 30 minutes

United States

- ...to Bangor, Maine by up to 1 hour

APPENDIX B

QUESTION 8

In 1999, how many trips, if any, do you plan to take to _____?

Montreal, Quebec, Toronto

- ...the Maritime Provinces in Canada?

New Brunswick, Nova Scotia

- ...other provinces in Canada (other than Maritime provinces) or states
in the United States?

APPENDIX C

QUESTION 9

If highway improvements were made which would reduce the driving time through Maine to _____ by _____, how would this impact the number of trips you would take through Maine on your way to Canada? Would you take more, fewer, or the same amount of trips through Maine?

Montreal, Toronto

- ...the Maritime Provinces by 1 hour and 25 minutes

Quebec

- ...the Maritime Provinces by up to 1 hour

New Brunswick, Nova Scotia

- ...Montreal by 1 hour and 25 minutes

APPENDIX D

QUESTION 10a

If highway improvements were made which would reduce the driving time through Maine to _____ by _____, how would this impact the number of trips you would take through Maine on your way to Canada? Would you take more, fewer, or the same amount of trips through Maine?

Montreal, Toronto

- ...the Maritime Provinces by 2 hours and 30 minutes compared to the Trans-Canada highway

Quebec

- ...the Maritime Provinces by up to 1 hour compared to the Trans-Canada highway

New Brunswick, Nova Scotia

- ...Montreal by 2 hours and 30 minutes compared to the Trans-Canada highway

Appendix C: Maine Business Survey Instrument & Comments

STATE OF MAINE
OFFICE OF THE GOVERNOR
1 STATE HOUSE STATION
AUGUSTA, MAINE
04333-0001

ANGUS S. KING, JR.
GOVERNOR

February 1, 1999

Dear Business Owner or Manager:

As you may know, the Maine Legislature recently directed the State's Planning Office and the Department of Transportation to undertake an analysis of economic, transportation and financing issues associated with the construction of an east-west highway across the State. These studies began in early October and will be completed in the Spring of 1999.

Anyone who has examined a map of Eastern Canada knows that Maine is strategically positioned between New Brunswick and Quebec. Proponents of an east-west highway have long believed that a safe, high-speed, border-to-border transportation facility will open the flow of international trade through Maine and bring needed economic development to the Central and Northern regions of our State. Whether the economic benefits of an east-west highway are real or imagined will depend in great measure on the future actions of thousands of individual companies located within and surrounding Maine. If Maine is to invest in the construction of an east-west highway, we must gain a better understanding of how the business community will respond.

Simply put, I am asking for your help. Working in cooperation with our neighboring States and Provinces, we are undertaking a survey of approximately 5,000 firms located throughout Maine, the Northeastern U.S., Atlantic Canada, Quebec and Ontario, who may be potential users of an east-west highway through Maine. The purpose of the enclosed survey is to gather input to assist us in making objective, supportable projections of future traffic levels, user benefits and resulting economic benefits. The survey is an important opportunity for manufacturing, distribution, trucking and other potential commercial users to participate in the planning and potential development of this transportation improvement. Even if you believe that the proposed highway has no future relevance to your company, your response is equally important to us and will directly impact the State's decision whether or not to proceed.

I would greatly appreciate your taking time to respond, or assign someone within your company to complete the enclosed questionnaire. Most of the questions will need to be addressed by someone who is familiar with your firm's frequency, volume, mode and origin/destination of shipments. Due to the geographic reach of the survey and variety of business that are being contacted, some of the enclosed questions may not be applicable to your company. However, please be as thorough as possible and return the instrument by postage-free mail or FAX within the next 10 business days.

Further instructions are provided on the form. If you have any additional questions, please feel free to contact our project consultants, RKG Associates, Inc. at (800) 555-7541 or (603) 868-5513 and ask for Gary Mongeon. If you prefer, e-mail messages can be sent to glm@rkg1.com.

Thank you for your cooperation and assistance.

Sincerely,

Angus S. King, Jr.
Governor

Survey of Potential Users of a Proposed International Trade Corridor Through the State of Maine

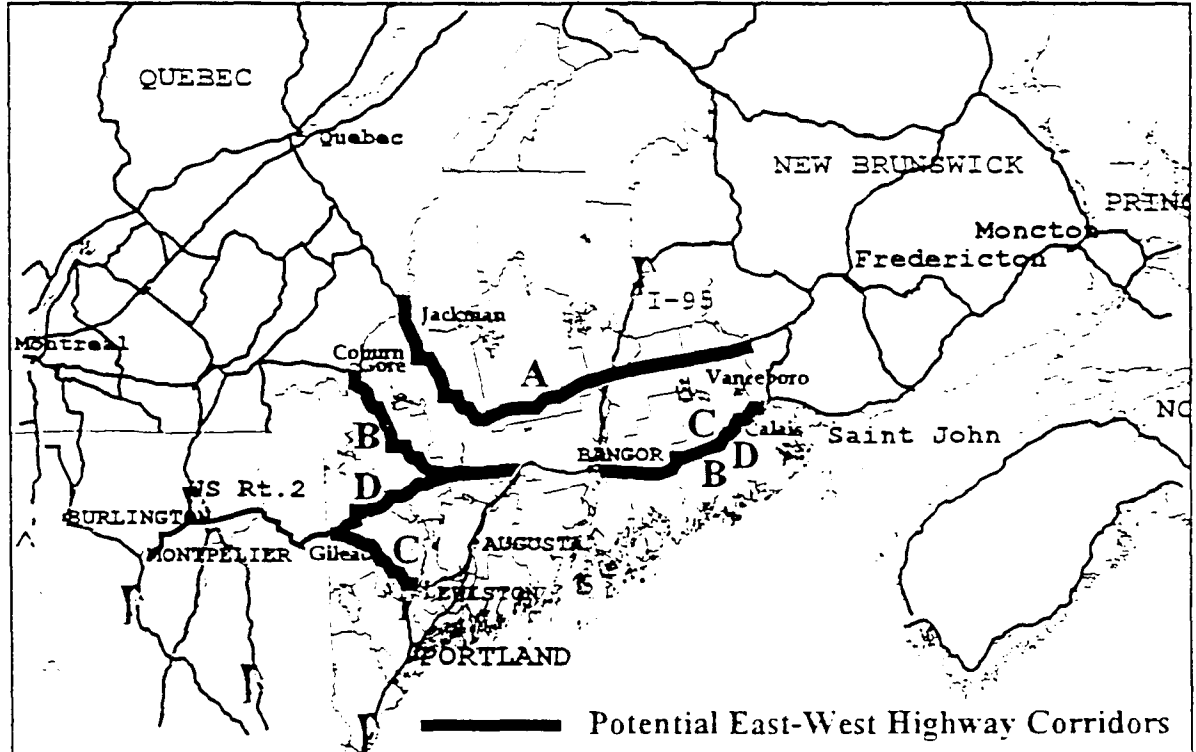

Maine State Planning Office

Maine Department of Transportation

ABOUT THE MAINE EAST-WEST HIGHWAY PROPOSAL

The East-West Highway would provide a new or improved border-to-border connection across the State of Maine, linking New Brunswick to the east, with Quebec or Northern NH to the west. In addition to servicing Canadian bound shipments through Maine, an east-west highway could provide improved safety, time and cost savings for Maine firms which seek to access markets in Central or Atlantic Canada, Northern NH and VT, Central and Western NY, and the Midwestern US. Four broad conceptual corridors are being considered for this project.

- Corridor A. Upgrade existing Route 6 from I-95 near Lincoln to the New Brunswick border at Vanceboro and connecting to McAdam, Fredericton and Moncton via NB route 4. Upgrade Route 6/16 to Route 201 near Bingham and Route 201 to the Quebec border, linking to Quebec City via Quebec Routes 173 and 73.
- Corridor B. Eastward from Bangor to the New Brunswick border at Calais and connecting to Saint John, Fredericton and Moncton via NB Routes 1&2. Westward from I-95 at a point between Newport and Augusta to the Quebec border at Coburn Gore, linking to Sherbrooke and Montreal via Quebec Route 10. (This concept is being evaluated as both a 2-lane upgrade and a 4-lane corridor.)
- Corridor C. A 4-lane corridor extending eastward from Bangor to the New Brunswick border at Calais and connecting to Saint John, Fredericton and Moncton via NB Routes 1&2. Westward from I-95 or I-495 at a point between Augusta and Gray, west to US Route 2 near the NH Border, linking to NH, VT and Montreal via US Route 2 and I-89.
- Corridor D. Upgrade existing Route 9 (Bangor to Calais) and Route 2 (Newport to Gilead) with local bypasses, safety improvements, passing lanes and related enhancements.

Levels of improvements under study range from section upgrades and safety improvements to existing routes, to the construction of a 4-lane, divided highway across the entire State. To help you estimate the impacts this proposed highway may have on your business, travel times and time savings compared to existing routes, are provided below for each of the conceptual East-West Highway Corridors, as well as major segments of those corridors to and from the City of Bangor. **Travel times and time savings shown are approximate.** Estimated savings are based upon reasonable and conservative assumptions concerning existing travel conditions and the nature of potential improvements. Based upon your own travel experience, you may believe that the proposed Corridors offer greater or lesser time savings than indicated below. **If so, we encourage you to respond to the survey questions by using your own expectations of the benefits offered by each Corridor.**

SURVEY INSTRUCTIONS:

Please answer each of the following questions as fully as possible, recognizing that some questions may not be applicable to all types of businesses and that ESTIMATES ARE ACCEPTABLE. If you have any questions regarding the purpose of this survey or how to interpret individual questions, we encourage you to contact our project consultant, RKG Associates, Inc. at (800) 555-7541 or (603) 868-5513 and ask for Gary Mongeon. Your participation is greatly appreciated.

Map ID	Corridor Description	Distance (Miles)	Travel Time	Time Savings
Border-to-border travel time and distance estimates - 4 lane controlled access corridors				
B	Calais to Coburn Gore via Route 9, I-95, US Route 2 & Route 16/27	230	3 Hrs 35 Min	1 Hr 20 Min
C	Calais to Gilead & NH border via Route 9, I-95, I-495 & US Route 2	250	4 Hrs 00 Min	1 Hr 00 Min
Border-to-border travel time and distance estimates - 2 lane upgraded corridors				
A	Vanceboro to Quebec Border via Routes 6/16 & 201	220	4 Hrs 05 Min	25 Min
B	Calais to Coburn Gore via Route 9, I-95, US Route 2 & Route 16/27	230	4 Hrs 15 Min	40 Min
D	NH to New Brunswick via upgrades to Routes 2 & 9	240	4 Hrs 30 Min	35 Min
Major segment travel time and distance estimates to/from Bangor- 4 lane controlled access corridors				
B&C	Bangor to Calais via Route 9	100	1 Hr 30 Min	30 Min
B	Bangor to Coburn Gore via I-95, US Route 2 & Route 16/27	130	2 Hrs 05 Min	50 Min
C	Bangor to Gilead & NH border via I-95, I-495 & US Route 2	150	2 Hrs 30 Min	30 Min
Major segment travel time and distance estimates to/from Bangor- 2 lane upgraded corridors				
B&D	Bangor to Calais via Route 9	100	1 Hr 50 Min	10 Min
B	Bangor to Coburn Gore via I-95, US Route 2 & Route 16/27	130	2 Hrs 25 Min	30 Min
D	Bangor to Gilead & NH border via I-95 & US Route 2	140	2 Hrs 40 Min	25 Min

NOTES:

- The following responses should apply **to this location only**. If you are a headquarters or branch plant of a company with multiple facilities, feel free to forward copies of this questionnaire to those sites also.
- The term "Atlantic Canada" appears in several of the following questions. For purposes of this survey, Atlantic Canada refers to the provinces of New Brunswick, Nova Scotia, Prince Edward Island and Newfoundland & Labrador. Eastern sections of Quebec should be identified with the Province of Quebec.
- Several of the following questions ask for information regarding numbers of **shipments** to or from your place of business to **regions** of origin or destination. For the purposes of this survey, please define a "shipment" as a quantity of goods which generates a trip to/from the indicated region of origin or destination. (For example, an out-bound truck containing deliveries for multiple customers located in Quebec, Ontario and the Midwest US in a single trip, should be defined as 1 shipment to each of those regions.)
- ALL INDIVIDUAL SURVEY RESPONSES WILL BE COMPLETELY CONFIDENTIAL.
- What is the primary business activity conducted at this location? (check one)

16. Please refer to the map at the beginning of the survey and consider the locations of your business, your customers and suppliers in relation to the proposed East-West Highway Corridors. Based upon your expectations of potential travel time savings offered by each, please rate each corridor on a scale of 1 (minimal/low use) to 5 (high level of use), in terms of its likelihood of being used as a shipping route to or from your place of business ...

Assuming that each Corridor provides the minimum border-to-border travel time savings (within a range of 25 to 40 minutes), as indicated by the 2-lane upgrade alternatives?

	# Responses	Likely Level of Usage					Don't Know/
		Low	1	2	3	4	
		1	2	3	4	5	N/A
Corridor A	95	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/> 22	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Corridor B	98	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/> 253	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Corridor C	96	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/> 257	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Corridor D	96	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/> 274	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

No Response - 20

Assuming that each Corridor provides the maximum border-to-border travel time savings (within a range of 1 hour to 1 hour and 20 minutes), as indicated by the 4-lane controlled-access alternatives?

No Response - 25

Likely Level of Usage					Don't Know/
Low.....High					N/A
1	2	3	4	5	

	# Responses	{ Reported Average Score }					# DK
Corridor A	86	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/> 2.2	<input type="checkbox"/>	<input type="checkbox"/>	32
Corridor B	90	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/> 2.5	<input type="checkbox"/>	<input type="checkbox"/>	30
Corridor C	89	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/> 2.5	<input type="checkbox"/>	<input type="checkbox"/>	30
Corridor D	89	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/> 2.7	<input type="checkbox"/>	<input type="checkbox"/>	30

17. Please rank the four corridors in terms of their greatest overall potential to be used by your company and suppliers (Rank 1 through 4, using 1 to indicate the Corridor which offers the greatest potential to be used.):

# Responses		AVG Rank	DISTRIBUTION OF RANKINGS			
			1	2	3	4
91	Corridor A	2.9 (4)	24	8	13	46
93	Corridor B	2.4 (2)	28	26	31	15
96	Corridor C	2.4 (3)	29	18	24	25
97	Corridor D	2.4 (1)	28	28	14	27

No Response = 50

NOTE: In the following series of questions, please assume that the "East-West Highway" refers to the Corridor which you ranked highest in terms of overall potential to be used by your company, your customers and suppliers.

18. In your opinion, what is the likelihood that your preferred corridor would provide the following benefits to your company...

Assuming the corridor provides the minimum travel time savings (within a range of 25 to 40 minutes), as indicated by the 2-lane upgrade alternatives?

All Corridors

30. If necessary, would you be willing to be contacted by the consultants working on this study, if they have any further questions or would like to discuss your responses in more detail?

☐ Yes 72
☐ No 54

If you do not mind being contacted, please provide your name and phone number:

Name: _____

Business phone: _____

31. Please use the following space to make any other comments you would like concerning the Maine East-West Highway.

Not Completed

TO RETURN YOUR COMPLETED SURVEY It is important to us for statistical sampling that we know the correct name and location of your company. If the affixed mailing label is missing or incorrect, please provide your company name and address in the space provided.

Company Name: _____

Mailing Address: _____

City: _____ State: _____ Zip: _____

Once you have finished filling out the survey, just fold it so that the Business Reply Mail return address appears on the outside. Place a piece of clear tape where indicated (*no staples please*) to secure the survey and keep it from unfolding. Then drop it in the mail. **No postage is required.** Or, you can fax the completed survey to RKG Associates, Inc. at (603) 868-6463. Questions related to this survey may be directed to Gary Mongeon at (800) 555-7541 or (603) 868-5513.

PLEASE RETURN YOUR COMPLETED SURVEY WITHIN 10 BUSINESS DAYS

Thank you again for your cooperation.

Southern Maine

Survey Number	Comments	COMPANY_ZI
87	Good Luck, lets just do it!	04005
61	This looks like a plan to have NB, Nova Scotia & Quebec us Maine is a drive thru!	04032-1001
58	Having reviewed the proposed corridors, I don't believe that I have any valuable input to the survey KLPD is a quasi-municipal consumed owned utility. The majority of these questins don't apply. but we wanted to respond since we received one of them,. We do very little shipping, mainly receive UPS order of equipment or supplies	04038
36	Does not apply to our business - small piping contracotr	04043-7073
57	will not impact cost of purchased item	04062-4351
138	Even though my response to this survey indicates any E/W corridor would not benefit our company I believe corridor A or B would be of benefit to Northern ME's economy.	04072
129	Anything you do to better ME infrastructure will help bring people to ME. Though your reasons may not be correct, tourism is the most important factor. Don't forget north south. Lets get people out of York Cnty, ie new Rt. 26 to Bethal to Ranglely t	04073
92	Safety a big concern to all of us. A 4 lane highway would certainly be safer, faster, save fuel and time.	04074-9306
31	Upgrade existing roads & bridges/filter in some passing lanes (on hills).Constructing a EW highway is an insult to the citizens of ME.We do not need it - why don't we all just move to NJ - People move to ME for a reason & it is not because we want***	04101
120	Much too detailed for a small company that operates no trucks. We simply do not have available much of the information requested.	04101-2408
75	No real interest in this subject as current highway system satisfies our use.	04101-2620
15	Bristol Seafood Inc.	04103
86	Note, as mentioned on page 4, we use small package services for the majority of our shipments (FEDX UPS).All other shipments are LTL outbound, though on occassion we will receive TL inbound shipments from US vendors located in Midwest, southeast/w	04103-1446
125	We would be a major user.Most of our deliveries are with 3or 4 axle straight trucks carrying buck and package petroleum products. our goods (equipment) corridor D for example our unit would stop 3-4 times before CAN.Return on different Rt. Our 18 ***	04104
140	Please delete from your mailing list - company has been sold	04112-5277
80	...Linking Eastern CAN to Western CAN will do nothing for the state of Maine except to cause its citizens increased taxes and fees to pay for the highway while ruining great tracts of precious land...	04116-2649
136	Long over due - Should not be a toll road like the ME Tpke. The people of Maine were lied to about removal of tolls after payment ? road	04210
96	Would not use any of these highways	04210-3719
116	We are a service company, some of these are hard to answer - W/E highway improvements would definitely impact our business in a positive way.	04211-1480
94	The highway would be more of a safety issue	04240-3510
60	This survey is ignorant of the true situation. ME has a small border with the rest of the US.The US is our major market.Because CAN produces exactly the same products which we produce in ME our ability to market in CAN is extremely limited. Espec***	04256
64	Useless survey	04256-5724
101	shipping to/from Canada most adequate to justify your time/expense	04276
104	4 lane highway unnecessary, advantage of a 2 lane highway to connect Great Lakes Region to Maine ports for quicker shipment	04347
132	I do not agree with the concept	04364
4	An East/West Highway would have no impact good or bad on my business. I am a local retail/wholesale business. for personal travel, a well built & well maintained road such as route 17 from Rockland to Augusta is fine but continue it to the N.Conw***	04841-2126
79	I would expect markets to open up in the Montreal and/or Quebec area(s) along w/lower costs to ship to Atlantic Canda. Currently the cost of transportation exchange rates consumer demand make it difficult to export to Canada. We are however *	04847
24	There is no proposal for the majority of Maine's population from Portland to Belfast. An E_W corridor from the Coast thru Augusta and continuing to Gilead makes sense	04856
98	I think more money should be spent on the roads in our area (from Bath to Bangor) It's ridiculous how bad the roads are in the mid-coast area, especially Rt. 1. Whenever we go to Brunswick I feel sickened at the paved, fenced in walkway which not used	04861
91	We do not ship out - we receive goods cannot accurately fill in %	04861-1622
130	What about Rail? What about Retail Shipments? What about widening existing southern ME Tpke? What about Tax impact? What about failure of NAFTA to faily lower duty (zero incoming duty - vs. duty going into Canada?	04864

Northern Maine

Survey Number	Comments	
14	Very hard to fill out survey my customers could come from all over the world. We move families to locations all over. I am sure we would use East-west highway whenever we could	04401-6701
33	In whatever form this highway finally happens, it will boost the economic welfare of all parts of Maine. This is a terrific opportunity which should not become bogged down in politics and policy works	04401-6880
108	There is nothing more important as a state project than building this.	04402
32	I can't believe you are using an out of state company to do this work - Is there no one in the state that could have done this?	04410
117	I would have no use for this highway - Thanks anyway	04427-3237
123	Maine EW highway need 100,000 ?? to help ME forest industry. This survey never mention safety	04428
29	My Co. would use such a road very little at this time.	04430-2710
21	If the goal of this project is to increase economic development, Corridor A or B would bring benefits to areas that need it much more than C or D. C&D pass through areas that are already highly developed & constantly growing. A&B pass through areas**	04457
5	Implementation of corridor A is highly critical to our current and future/expanding transportation business. We have a very significant percentage of buss. ALONG the proposed corridor A route within the State of ME, but close to Canadian borders*	04457
34	I am a small wholesale & retail farmer. My whole operation is run in the town of Lincoln	04457-9507
111	We use mostly "common carriers" (roadway LF, APA, etc.) their routes are driven by their terminals & distrib.system, Thus, having a more direct route may not even be option to them. In other words, in/out will still funnel down I-95	04473-1728
17	Corridor A, Rt. 201 Quebec border to Newport I-95 upgrade two lane with r/w for 4 lane for future. Corridor D same. Look at map page 1. Don't forget County N.B., P.Q. MAINE same truck weights	04497-9505
152	If a new hiway is built from Calais, it should be closer to the coast to be useful to ME citizens & businesses. Rt 9 needs a little more work but is otherwise adequate to serve Can. trucks. We would prefer to see Can. ship across ME by rail.	04605
84	We do not use freight for incoming or outgoing shipments. However as a business we feel a good EW highway is essential if we are to be competitive as a whole in the market place.	04609
39	I would like to see improvement on the existing roads which we as a local business currently use.	04622-9801
83	My initial reaction to EW Highway is as follows. More benefit occur to Ontario and Quebec than to ME. Because most of the freight is incoming. The same is true of the Maritimes. Most of the benefit of improved EW travel/via passenger car occur to***	04640
137	It would have little influence on our business	04658
10	An east-west highway would have little impact on our business. It would be helpful to us privately to move around the state. Money spent to increase ? high-tech jobs and education would have a much greater return to the state and its citizens. *	04679
128	I believe monies could be more wisely spent by improving our existing road. If the State of ME has a surplus road budget the improvement of Rt 1 from Houlton to Ft. Kent would be very economical for Aroostook Cnty and the State of ME. We do not need ***	04736-4257
46	Your questionnaire doesn't apply to us. The proposed routes do not help us. We need help in getting intermodal rail transportation going. The Bangor intermodal site will be & is better than the proposed route which leave us out.	04742
122	The proposed EW highway is of no use to us in Northern ME. We need a north-south highway. We already have a good EW corridor in Canada	04756
112	I would not be for it at all. I feel you should finish the 95 to go all the way to Ft. Kent or Madawaska before you even think of expanding these roads	04756-9706
109	For our company, I see almost no use for the EW Highway. Our northerly location put us next to the Trans Canada anyway. However, our biggest competition in our seed markets is N.B. & P.E.I. We are already at a big disadvantage because of the Can. ***	04769
23	The east west highway would be much greater benefit to Canadian economy than to ME. It would open US markets to natural resource products from the maritime provinces on a more competitive basis.	04769
142	Canada discourages sales of Maine finished products *	04912
40	We need a connection between Greenville and Kingfield	04927
25	How about maintaining existing roads better	04930
48	East-west highway essential for economic growth in central/northern ME	04945
145	Forget East - West Highway. Allow 100,000 lb loads on all highways including Interstate 95. Make frequent truck turnouts on Rt. 201 from Skowhegan to Canadian border	04957-3304
66	The fields from which we harvest crops are located on Rt. 2 - We favor Plan 4	04958
69	On Rt. 16/27 year round access would be good for the forest ind.	04958-9801
28	Easier access and east of travelers to find my location will help. I am planning the first ever in the world Monster Truck World Series - If I can get the money (DA&Fleet Bank) off my back to promote the show it could mean up to 20,000 people travel***	04962
105	A Maine East West Highway would have little, if any direct impact on our business.	04976-1961
	Tourism would be improved. In speaking with a tour bus driver from Montreal, driver says: " Rt. 2 is worst he has to travel from Que to Maritimes. Many of passengers get sick. I ask them, if they can, to refrain from eating." Rt. 2 definitely needs*
