STATE OF MAINE
DEPARTMENT OF ENVIRONMENTAL PROTECTION

ANGUS S. KING, JR.
GOVERNOR

MARTHA KIRKPATRICK
COMMISSIONER

January 15, 2001

Senator John L. Martin, Chair
Representative Scott W. Cowger, Chair
Joint Standing Committee on Natural Resources
State House Room 437
Augusta, Maine 04333

RE: Report on Toxic Reduction Goals

Dear Senator Martin, Representative Cowger and Members of the Committee:

Pursuant to the state's Toxics Reduction Law, Title 38 § 2303.5, I am pleased to submit the attached report on Toxic Reduction Goals and additional toxics information the department collects. The report shows a commitment to continual progress by the regulated facilities and a summary of the wide variety of related toxics information the department collects. The Toxic Reduction Staff look forward to providing a briefing and reviewing this report with you.

Sincerely,

Martha G. Kirkpatrick

GOALS REPORT TOXICS REDUCTION LAW

This report is required by the state's Toxics Reduction Law, Title 38 § 2303.5. Progress evaluation; report, calls for 1) an evaluation of statewide goals; 2) an evaluation of the adequacy of facility goals and facility progress; and 3) summaries of other related toxics and hazardous waste information the Department collects but is not subject to this law.

1. The **statewide reductions achieved**, as of July 1, 2000, are as follows:

Toxic Use	37% reduction
Toxic Release	57% reduction
Hazardous Waste	45% reduction

2. **Adequacy of goals set by facilities.** As required by the Toxics Reduction Law, complete report data for all facilities, including goals and progress to date, are attached (attachments A.1 – A.3). These reports, plus additional information on the Toxics Reduction Law, are also available on the web at www.mainedep.com (click Maine Toxics).

Attachments B.1 – B.3 are summaries of the range of goals set by facilities. Facilities are required to set goals for 2002, 2004 and 2006. DEP will need to evaluate how the facilities do over time with these goals in order to evaluate their adequacy. The goals appear to be consistent with continual improvement and staff are encouraged by the aggressive goals many companies have chosen.

3. **Additional Information.** The following is a summary of program information on the use and release of toxics and hazardous materials not subject to the TUR law, but which the Department collects and maintains data for informational, planning or regulatory programs within specific DEP bureaus.

A. Bureau of Air Quality

Chapter 137, Emissions Statements of the Rules Standards of the Department of Environmental Protection Regulation: establishes the requirements for reporting "toxic compounds" from stationary sources of air pollution. It applies to those sources that either use, process, manufacture, or emit any compound at or above the thresholds listed in Chapter 137 Emission Standards, or where actual emissions are known. Data is attained from point sources including stacks and vents. The following are program highlights:

Regulated Community:	110 facilities report.
Regulated Compounds:	214 compounds includes some Toxic Release Inventory (TRI) compounds and 188 compounds of the Hazardous Air Pollutants (HAPs) list plus a handful of other chemicals such as the total reduced sulfur compounds (methyl mercaptan, hydrogen sulfide.).
Reported Compounds in Maine:	66 compounds.
Threshold:	2000 pounds, (this is lower than the federal Toxic Release Inventory threshold) except carcinogens, which are 200 pounds, and a few are lower numbers.

MACT (Maximum Achievable Control Technology) standards are federal regulations under Title III of the Clean Air Act Amendments of 1990. As the name implies, these regulations are technology-based, and will lead to reductions in the emissions of 188 Hazardous Air Pollutants (HAPs) by requiring improved air pollution control equipment and techniques on a wide variety of industrial and commercial sources of air pollution. Technology-based means that controls are based on pollutant-reducing equipment already in use by similar industries. This means that public health is not necessarily protected; reductions certainly occur, but they may not be sufficient. Congress recognized this, and provided for a "residual risk" program that would go into effect after MACT controls. The residual risk program would evaluate the source-specific risk to the local residents, and would require additional controls as needed.

There are a total of 174 industrial and commercial source categories that are currently, or are scheduled to be, regulated with new MACT standards.

Most MACT standards apply only to major sources of hazardous air pollutants, which are facilities that have the potential to emit above 10 tons per year (tpy) HAP or 25 tpy sum of all HAPs. The exceptions to this consist of a handful of "area source" MACT standards, and apply to any facility of any size that performs the affected activity. The area source MACT standards that have sources in Maine are: Chromium Electroplating, Halogenated Solvent Cleaning, Commercial Dry Cleaning, Portland Cement and the Secondary Aluminum Processing

The information on the HAPs emitted by major sources is collected via TRI reports and the Toxic Emission Inventory Report (Chapter 137). Emissions from area sources are estimated using population density, area source location, and emission factors.

The MACTs which affect sources in Maine are as follows:

Dry Cleaning-	~80 area sources
Pulp and Paper-	7 major sources
Chrome Plating-	2 area sources
Halogenated Solvent-	1 major source & 2 area sources
Portland Cement-	1 area source
Amino/Phenolic Resins-	1 major source
Shipbuilding and Repair-	1 major source
Secondary Aluminum Processors-	2 area sources

Ambient Monitoring Program: Data is being collected for ambient air, which consists of all air outside of buildings, stacks or exterior ducts. Ambient Monitoring programs currently active:

Mercury wet deposition monitoring:

- Greenville, Bridgton, Freeport, Acadia.

Polycyclical Aromatic Hydrocarbons (PAHs) wet and dry deposition monitoring:

- Freeport

Metals wet and dry deposition monitoring:

- Freeport

Volatile organic compound monitoring including halogenated hydrocarbons

- Rumford

- Portland

B. Bureau of Remediation and Waste Management

Hazardous Waste Annual Report Forms : These are required to be submitted by hazardous waste generators. Approximately 125 facilities get the full federal form and the DEP requests the following type of information be answered: facility location, quantities generated, types of treatments on site, disposal on site, release to Publicly Owned Treatment Works Facilities (POTWs), types of on-site process systems available, waste received from off site, including types and amounts, and waste shipped off site. Most of these facilities report to the Toxics Reduction Program unless they fall under an exemption.

1999 Manifest Summary Forms: Forms are sent out to approximately 500 facilities that ship hazardous waste of smaller quantities than the fully regulated facilities. This is a simple check of amounts of waste and a reconciliation of the manifest numbers. Summaries are provided to assist hazardous waste generators and facility operators complete the annual report form.

Annual Hazardous Waste Activity Report: This report is based on data from Hazardous Waste Report Forms. It is the Department's summary of hazardous waste generated, shipped, handled and treated in the state of Maine. It includes data on waste leaving as well as coming into the state and data on facilities located in and outside the state that treat or dispose of hazardous waste. It also includes a list of Licensed Hazardous Waste Transporters. A summary is provided of amounts of waste generated, treated, disposed of and transported in the state of Maine.

Hazardous Waste Manifest System: Any facility that generates hazardous waste must fill out paperwork to ship the waste off site by a hazardous waste transporter. The manifest data includes shipments from those facilities required to submit hazardous waste annual reports plus one-time generators of hazardous waste and small quantity generators. In 1999, 22,543,042 pounds of hazardous waste were shipped. Approximately 22,764,319 pounds of hazardous waste were shipped in 2000, however the amounts have not been completely quantified.

Quarterly Hazardous Waste Reports: Hazardous waste transporters submit quarterly reports documenting pounds of hazardous waste transported, collection locations and locations/methods of treatment or disposal. Transporters pay fees based on quantities and methods/treatments.

C. Bureau of Land and Water Quality

Chapter 530.5 Surface Water Toxics Program: The bureau has collected data from effluents for five years with approximately 130,000 data point results. The facilities required to do testing under this program are determined by the Land and Water Bureau "Toxics Rule". This program regulates industrial dischargers and many municipal treatment plants. The program requires testing for EPA priority pollutants (approximately 126 compounds: metals, organics, pesticides, PCB's) as well as a few other pollutants such as aluminum and ammonia.

Surface Water Ambient Toxics (SWAT) Monitoring Program: The program collects data on concentrations of heavy metals, pesticides and other organics in fish, shellfish, water, sediments and wildlife covering 10 years. Most of the data has been gathered since 1994, when the program was approved. Sampling sites may include sites upstream and downstream of known pollutant sources, or may be dependent on sampling locations of the Department of Inland Fish and Wildlife.

National Mercury Deposition Network (partly funded by SWAT): DEP collects data on mercury in rainwater at 4 stations in Maine.

Dioxin, Mercury and PCB Monitoring of Fish: The program collects fish sampling data annually for dioxin since 1988. As a result Maine has a statewide fish consumption advisory because of mercury and additional restrictions on consumption of fish from specific rivers because of dioxin and PCBs.

Mercury Monitoring of Select Vertebrates: Sampling and analysis have found that 28% of Maine loons have high mercury levels and experience a 50% reduction in number of chicks hatched. Collected data indicates that cormorants are also affected.

* New chemical added after baseline year. This represents an increase in the chemical. However, a percentage increase can not be calculated for this chemical due to a zero in the denominator of the reduction formula. Future Reduction Goals for this chemical indicate projected reductions of the amount shown in column "1999 Adjusted Amount".

Toxic & Hazardous Waste Reduction Law - 2000

Hazardous Waste Reports

Town	Company	Hazardous Waste Code	Waste Code Description	Base Year Amount (lbs.)	1999 Amount (lbs.)	1999 API	1999 Adjusted Amount (lbs.)	1999 Reduction % or Increase %	Waste Minimization Code	Future Reduction Goal 2002 (%)	Future Reduction Goal 2004 (%)	Future Reduction Goal 2006 (%)	Product Unit I.D.	Future Method Reduction Waste Minimization Codes
Reductions unadjusted by API				11,776,679	5,908,964			-49.82						

* New waste added after baseline year. This represents an increase in the waste. However, a percentage increase can not be calculated for this waste due to a zero in the denominator of the reduction formula. Future Reduction Goals for this waste indicate projected reductions from the amount shown in column "1999 Adjusted Amount".

 223 Facilities

Future Goals Set by Facilities*

Future Goal Ranges
 -100 to -50 (reduction)
 -49 to -1 (reduction)
 0 (no change)
 1 to 50 (increase)
 51 to 100+ (increase)

* Future goals are set from a baseline year. Future reduction goals are indicated by a negative number (shown in shades of green). A complete elimination of a chemical(s) is -100. No change from the baseline is indicated by 0 (shown in black). Future **increase** goals are indicated by a positive number (shown in shades of red). Each portion of the pie chart indicates the percentage of facilities that have chosen a future goal in the range indicated.
